# On $C^{1}$-extension and $C^{1}$-reflection of subharmonic functions from Lyapunov-Dini domains to $\mathbb{R}^{N}$ 

P.V. Paramonov*

For Lyapunov-Dini domains $D$ in $\mathbb{R}^{N}(N \in\{2,3, \ldots\})$ we study the possibility of $C^{1}$ extension and $C^{1}$-reflection of subharmonic functions in $D$ of the class $C^{1}(\bar{D})$ through the boundary of $D$ to all of $\mathbb{R}^{N}$.

Bibliography: 14 titles.

## 1 Introduction

For previous results on $C^{m}$-extension of subharmonic functions we refer the reader to [1] - [5] and literature therein. In these papers one can find several different settings of the problem. Here we deal with the following particular question (and related results).

For which compact sets $X$ in $\mathbb{R}^{N}$ any function $f \in C^{1}(X)$ subharmonic on the interior of $X$ can be extended to a function $F$ subharmonic and $C^{1}$ on all of $\mathbb{R}^{N}$ with the property $\|F\|_{C^{1}\left(\mathbb{R}^{N}\right)} \leq A_{X}\|f\|_{C^{1}(X)}$ (with $A_{X} \in(0,+\infty)$ depending only on $X$ )?

The main result of this paper (Theorem 3) says that the previous property is satisfied by any $C^{1}$-smooth closed bounded domain $X$ in $\mathbb{R}^{N}(N \geq 3)$ with connected complement and with the so-called Log-Dini-property. An analogous result for the case $N=2$ was obtained in [3] by different methods (for balls in $\mathbb{R}^{N}$ it appeared earlier in [2]). We also prove several auxiliary results (having their own interests) on harmonic and subharmonic $C^{1}$-reflection (Theorems 1, 3.1 and 3.5) and give several examples (see Section 4) showing that the (sufficient) conditions of our theorems are close to be sharp. Now we go to precise definitions, notations and statements.

A function $\varepsilon(\cdot) \in C([0,+\infty))$ with the properties $\varepsilon(0)=0, \varepsilon:(0,+\infty) \rightarrow(0,+\infty)$, $\varepsilon(\cdot)$ is (nonstrongly) increasing and $\varepsilon(t) / t$ is decreasing on $(0,+\infty)$,

$$
\begin{equation*}
\int_{0}^{1} \frac{\varepsilon(t)}{t} d t<+\infty \tag{1.1}
\end{equation*}
$$

is called a "Dini-type" function.
A $C^{1}$-smooth bounded domain $D$ in $\mathbb{R}^{N}(N \in\{2,3, \ldots\}$ is fixed) is called "LyapunovDini" (L-D) domain if there exists a Dini-type function $\varepsilon(\cdot)$ (called a Dini-function for $D)$ such that for each $\mathbf{x}$ and $\mathbf{y}$ on $S=\partial D$ one has

$$
\begin{equation*}
\left|\mathbf{n}_{\mathbf{x}}^{i}-\mathbf{n}_{\mathbf{y}}^{i}\right| \leq \varepsilon(|\mathbf{x}-\mathbf{y}|), \tag{1.2}
\end{equation*}
$$

where $\mathbf{n}_{\mathbf{x}}^{i}$ means the $\operatorname{inward}$ (with respect to $D$ ) unit normal to $S$ at $\mathbf{x} \in S$.

[^0]As usual, $\bar{E}, E^{\circ}, \partial E$ mean the closure, the interior and the boundary of the set $E \neq \emptyset$ in $\mathbb{R}^{N},\|f\|_{E}=\sup _{\mathbf{x} \in E}|f(\mathbf{x})|$ is the uniform norm of the function $f$ on $E$ (and $\|\cdot\|=\|\cdot\|_{\mathbb{R}^{N}}$. For an open set $\Omega$ in $\mathbb{R}^{N}$ we denote by $H(\Omega)$ (respectively, $S H(\Omega)$ ) the class of all (real) functions harmonic (respectively, subharmonic) in $\Omega$.

Recall, that for a closed set $X$ in $\mathbb{R}^{N}$ and $m \in\{0,1,2, \ldots\}$ one defines $C^{m}(X)$ as $\left.C^{m}\left(\mathbb{R}^{N}\right)\right|_{X}$ with the norm

$$
\|f\|_{m, X}=\inf \|F\|_{m},
$$

where the last infimum is taken over all functions $F \in C^{m}\left(\mathbb{R}^{N}\right)$ with the property $\left.F\right|_{X}=f$ and $\|F\|_{m}:=\max _{|\beta| \leq m}\left\{\left\|\partial^{\beta} F\right\|\right\}<+\infty$. Notice that in the case $X=\overline{X^{0}}$, for each $f \in C^{m}(X)$ the derivatives

$$
\partial^{\beta} f(\mathbf{x})=\frac{\partial^{|\beta|} f(\mathbf{x})}{\partial x_{1}^{\beta_{1}} \ldots \partial x_{N}^{\beta_{N}}}
$$

with $|\beta|:=\beta_{1}+\cdots+\beta_{N} \leq m\left(\beta=\left(\beta_{1}, \ldots \beta_{N}\right), \beta_{n} \in\{0,1,2, \ldots\}\right)$ are uniquely defined for all $\mathrm{x} \in X$, and so in this case $C^{m}(X)$ can be identified with the Whitney-jet space $C_{j e t}^{m}(X)$ (see [6]). If $m=0$, we omit the index $m$ in notations of $C^{m}(X)$ and $\|\cdot\|_{m, X}$.

In what follows we fix $N \in\{2,3, \ldots\}$, an arbitrary Dini-function $\varepsilon(\cdot)$ and $d \in(0,+\infty)$. Let $D$ be a (L-D) domain in $\mathbb{R}^{N}$ with Dini-function $\varepsilon(\cdot)$ and diam $D<d$ ( $d$ should be large enough for $D$ to exist). Set $D_{o}=\mathbb{R}^{N} \backslash \bar{D}$. The constant $A \in(0,+\infty)$ in the following Theorems 1-3 depends only on $N, \varepsilon$ and $d$.
Theorem 1. Let $u_{i} \in H(D) \cap C^{1}(\bar{D})$ and $u_{o}$ be the (only) solution of the Dirichlet problem in $D_{o}$ with the boundary data $\left.u_{o}\right|_{\partial D_{o}}=\left.u_{i}\right|_{\partial D_{o}}$ (in the unbounded component of $D_{o}$ we additionally require $u_{o}(\infty)=0$ for $N \geq 3$ or $\left|u_{o}(\infty)\right|<+\infty$ for $N=2$, where $u_{o}(\infty)=\lim _{|\mathbf{x}| \rightarrow+\infty} u_{o}(\mathbf{x})$ must exist $)$. Then $u_{o} \in C^{1}\left(\overline{D_{o}}\right)$ and

$$
\begin{equation*}
\left\|u_{o}\right\|_{1, \overline{D_{o}}} \leq A\left\|u_{i}\right\|_{1, \bar{D}} . \tag{1.3}
\end{equation*}
$$

We shall say that $u_{o}$ is the $C^{1}$-reflection of $u_{i}$ over (or through) the boundary $S$ of the domain $D$. We have a useful generalization of this result in Theorem 3.1 below. From Theorem 1 we obtain the following " $C^{1}$-extension" result.

Theorem 2. Suppose that $D$ has connected complement and $u_{i} \in H(D) \cap C^{1}(\bar{D})$. Then one can find a function $F \in C^{1}\left(\mathbb{R}^{N}\right) \cap S H\left(\mathbb{R}^{N}\right)$ for $N \geq 3\left(F \in C_{l o c}^{1}\left(\mathbb{R}^{N}\right) \cap S H\left(\mathbb{R}^{N}\right)\right.$ for $N=2$ ) such that $\left.F\right|_{\bar{D}}=u_{i}$ and

$$
\begin{array}{ll}
\|F\|_{1} \leq A\left\|u_{i}\right\|_{1, \bar{D}}, & N \geq 3,  \tag{1.4}\\
\|\nabla F\| \leq A\left\|\nabla u_{i}\right\|_{\bar{D}}, & N=2 .
\end{array}
$$

It is well known that $\mathbb{R}^{N} \backslash D$ (and then $D_{o}$ ) is connected if and only if $S=\partial D$ is. The next "localization" property can be useful in applications.

Corollary 1. Suppose that $D$ has connected complement and $f \in S H(D) \cap C^{1}(\bar{D})$. If for each $\mathbf{a} \in \partial D$ there is a ball $B_{\mathbf{a}}$ centered at $\mathbf{a}$ and $g_{\mathbf{a}} \in S H\left(B_{\mathbf{a}}\right) \cap C^{1}\left(\overline{B_{\mathbf{a}}}\right)$ with $\left.g_{\mathbf{a}}\right|_{B_{\mathbf{a}} \cap D}=f$ then there exists $F \in S H\left(\mathbb{R}^{N}\right) \cap C^{1}\left(\mathbb{R}^{N}\right)$ if $N \geq 3$ (respectively, $F \in S H\left(\mathbb{R}^{N}\right) \cap C_{\text {loc }}^{1}\left(\mathbb{R}^{N}\right)$ if $N=2$ ) with $\left.F\right|_{\bar{D}}=f$ and $\|F\|_{1}<+\infty$ (respectively, $\|\nabla F\|<+\infty$ if $N=2$ ).

And the main goal of this paper is the following.

Theorem 3. Suppose that $D$ has connected complement and $\varepsilon(\cdot)$ satisfies the so-called "Log-Dini" property

$$
\int_{0}^{1} \frac{\varepsilon(t)}{t} \log \left(\frac{1}{t}\right) d t<+\infty
$$

Then for each $f \in S H(D) \cap C^{1}(\bar{D})$ one can find $F \in S H\left(\mathbb{R}^{N}\right) \cap C^{1}\left(\mathbb{R}^{N}\right)$ if $N \geq 3$ (or $F \in S H\left(\mathbb{R}^{N}\right) \cap C_{\text {loc }}^{1}\left(\mathbb{R}^{N}\right)$ if $N=2$ ) with $\left.F\right|_{\bar{D}}=f$ and

$$
\begin{array}{ll}
\|F\|_{1} \leq A\|f\|_{1, \bar{D}}, & N \geq 3, \\
\|\nabla F\| \leq A\|\nabla f\|_{\bar{D}}, & N=2 . \tag{1.5}
\end{array}
$$

The last theorem is based on a constructive, but rather technical result, Theorem 3.5 , that seems to be useful in applications (the $C^{1}$-reflection property for subharmonic functions).

As far as we know, Theorems 1-3 are new for all $N \geq 3$ even for the so-called Lyapunov domains ((L-D) domains with $\left.\varepsilon(t)=t^{\alpha}, \alpha \in(0,1)\right)$.

The formulated results were obtained during the autumnal semester of 2007 at the University of Helsinki. The author is grateful to the University and the Academy of Finland for hospitality and financial support. Especially many thanks are due to Pertti Mattila for his attention to this work.

## 2 Proofs of Theorems 1 and 2

In the sequel we denote by $A_{0}, A_{1} \ldots$ some (fixed in this section) positive constants, which (in the long run) depend only on $N, \varepsilon(\cdot)$ and $d$ (this is important for the proofs of Theorems 1-3 and will be discussed in each nontrivial situation). The constants $A_{N}$ (depending only on $N$ ) and $A$ (depending on $N, \varepsilon(\cdot)$ and $d$ ) can be different in different accuracies. Set $B(\mathbf{a}, r)=\left\{\mathbf{x} \in \mathbb{R}^{N}| | \mathbf{x}-\mathbf{a} \mid<r\right\}$ and $\bar{B}(\mathbf{a}, r)=\left\{\mathbf{x} \in \mathbb{R}^{N}| | \mathbf{x}-\mathbf{a} \mid \leq r\right\}$ $\left(\mathbf{a} \in \mathbb{R}^{N}, r>0\right)$.

First we formulate several auxiliary results, which basically (but sometimes not so easy) follow from [7, Theorems $2.2-2.5]$. We decided, for completeness and for the reader's convenience, to present the detailed proofs of these results in Section 4 below (see Theorems 4.4-4.9).
Theorem W1. Let $D$ be a (L-D) domain in $\mathbb{R}^{N}$ with Dini-function $\varepsilon(\cdot)$ and diam $D<d$, $S=\partial D$. Let $\psi \in C(S)$ and $u_{i}$ (respectively, $u_{o}$ ) be the solution of the Dirichlet problem in $D$ (respectively, $D_{o}=\mathbb{R}^{N} \backslash \bar{D}$ ) with the boundary data $\psi$.
(1) If $\psi \in C^{2}(S)$ then $u_{i}$ and $u_{o}$ are of the class $C^{1}(\bar{D})$ and $C^{1}\left(\overline{D_{o}}\right)$ respectively, and satisfy the estimates:

$$
\begin{align*}
& \left\|u_{i}\right\|_{1, \bar{D}} \leq A_{0}\|\psi\|_{2, S}, \\
& \left\|u_{o}\right\|_{1, \overline{D_{o}}} \leq A_{0}\|\psi\|_{2, S} . \tag{2.1}
\end{align*}
$$

(2) Let $\mathbf{a} \in S, r \in(0, d / 2)$, and suppose that $\psi=0$ on $S \cap B(\mathbf{a}, r)$. Then $u_{i}$ and $u_{o}$ are of the class $C^{1}(\bar{D} \cap \bar{B}(\mathbf{a}, r / 2))$ and $C^{1}\left(\overline{D_{o}} \cap \bar{B}(\mathbf{a}, r / 2)\right)$ respectively, with

$$
\left|\frac{\partial u_{i}}{\partial \mathbf{n}_{\mathbf{a}}^{i}}\right|+\left|\frac{\partial u_{o}}{\partial \mathbf{n}_{\mathbf{a}}^{o}}\right| \leq \frac{A_{0}}{r} \log \left(\frac{d}{r}\right)\|\psi\|_{S},
$$

where $\mathbf{n}_{\mathbf{a}}^{o}=-\mathbf{n}_{\mathbf{a}}^{i}$ is the outward normal to $S$ at $a \in S$.
(3) Let $N \geq$ 3. Let $D_{*}$ be the unbounded component of $D_{o}, S_{*}=\partial D_{*}$, and $w \in$ $H\left(D_{*}\right) \cap C\left(\overline{D_{*}}\right)$ be such that $\left.w\right|_{S_{*}}=0$ and $w(\infty)=1$. Then $w \in C^{1}\left(\overline{D_{*}}\right),\|w\|_{1, \overline{D_{*}}} \leq A_{0}$ and for each $\mathbf{a} \in S_{*}$ one has

$$
A_{0} \frac{\partial w}{\partial \mathbf{n}_{\mathbf{a}}^{o}} \geq 1
$$

In Theorem W1 (1) we cannot, in general, put $\|\psi\|_{1, S}$ instead of $\|\psi\|_{2, S}$ (see [7, Remark 1] and Example 4.1 below). It should be said that the dependence of $A_{0}$ only on $N, \varepsilon, d$ was not ascertained in [7].

Proof of Theorem 1. First we reduce the proof to the case when $u_{i}$ can be extended as a harmonic function on some neighborhood of $\bar{D}$, so that $\left.u_{i}\right|_{\partial D}$ belongs to the class $C^{2}(S)$ and so, by Theorem W1 (1), we have $u_{o} \in C^{1}\left(\overline{D_{o}}\right)$. In fact, suppose we have proved (1.3) for all such $u_{i}$. In general case, by [8, Corollary 6.3] we can find a sequence $\left\{v_{i s}\right\}_{s=1}^{+\infty}$, each $v_{i s}$ is harmonic on (it's own) neighborhood of $\bar{D}$, such that $u_{i}=\sum_{s=1}^{+\infty} v_{i s}$ and $\left\|v_{i s}\right\|_{1, \bar{D}} \leq 2^{2-s}\left\|u_{i}\right\|_{1, \bar{D}}$. Define $v_{o s}$ by $v_{i s}$ (like $u_{o}$ by $\left.u_{i}\right)$, so that $v_{o s} \in H\left(D_{o}\right) \cap C^{1}\left(\overline{D_{o}}\right)$, $\left\|v_{o s}\right\|_{1, \overline{D_{o}}} \leq A\left\|v_{i s}\right\|_{1, \bar{D}}$. Then $v_{o}=\sum_{s=1}^{+\infty} v_{o s}$ gives the result. So we can always assume that $u_{o} \in C^{1}\left(\overline{D_{o}}\right)$.

Set $h_{i}(\mathbf{x})=\partial u_{i} / \partial \mathbf{n}_{\mathbf{x}}^{i}$ (respectively, $h_{o}(\mathbf{x})=\partial u_{o} / \partial \mathbf{n}_{\mathbf{x}}^{o}$ ), where $\mathbf{x} \in S$ and $\mathbf{n}_{\mathbf{x}}^{i}$ (respectively, $\mathbf{n}_{\mathbf{x}}^{o}$ ) is the unit inward normal to S at $\mathbf{x}$ with respect to the domain $D$ (respectively, $D_{o}$ ).

It is well known (see $[9$, Ch. $2, \S 6.5,(27)])$ that if we set $u=u_{i}$ in $\bar{D}$ and $u=u_{o}$ in $D_{o}$ then

$$
\begin{equation*}
\Delta u=\left(h_{i}+h_{o}\right) \sigma \tag{2.2}
\end{equation*}
$$

in the distributional sense, where $\sigma$ is the ( $N-1$ )-dimensional (Lebesque) surface measure on $S$. Denote by $\Phi_{N}(\mathbf{x})=\Phi(\mathbf{x})$ the standard fundamental solution for the Laplacian $\Delta$ in $\mathbb{R}^{N}$ :

$$
\Phi_{2}(\mathbf{x})=(1 / 2 \pi) \log |\mathbf{x}|, \quad \Phi_{N}(\mathbf{x})=-\frac{1}{\sigma_{N}(N-2)|\mathbf{x}|^{N-2}}, \quad N \geq 3
$$

where $\sigma_{N}$ is the (value of the) surface measure of the unit sphere in $\mathbb{R}^{N}$.
Put $h=h_{i}+h_{o}$ on $S$, so that by the classical Liouville theorem we have

$$
\begin{equation*}
u(\mathbf{x})=(\Phi *(h \sigma))(\mathbf{x})+c_{2}=\int_{S} \Phi(\mathbf{x}-\mathbf{y}) h(\mathbf{y}) d \sigma_{\mathbf{y}}+c_{2} \tag{2.3}
\end{equation*}
$$

where $c_{2}=0$ for all $N>2$ and $\left|c_{2}\right| \leq\left\|u_{i}\right\|_{S}$ for $N=2$. It is enough, by the maximum principle, to (properly) estimate $\left\|h_{o}\right\|_{S}$. In fact, since $u_{i} \in C^{1}(\bar{D})$ and $u_{o} \in C^{1}\left(\overline{D_{o}}\right)$, we have

$$
\nabla u_{o}(\mathbf{y}) \rightarrow h_{o}(\mathbf{x}) \mathbf{n}_{\mathbf{x}}^{o}+\nabla u_{i}(\mathbf{x})-h_{i}(\mathbf{x}) \mathbf{n}_{\mathbf{x}}^{i}
$$

as $\mathbf{y} \rightarrow \mathbf{x} \in S, \mathbf{y} \in D_{o}$, so that, since $\left\|u_{o}\right\|_{\overline{D_{o}}}=\left\|u_{i}\right\|_{\overline{D_{i}}}$, it would be enough to prove that $\left\|h_{o}\right\|_{S} \leq A\left\|u_{i}\right\|_{1, S}$. Then the jet ( $\left.u_{o}, \nabla u_{o}\right)_{\overline{D_{o}}}$ can be extended to some function of the class $C^{1}\left(\mathbb{R}^{N}\right)$ by Whitney theorem [6] which also gives the estimate (1.3).

We are first going to obtain a priori type estimate of $h_{o}$.
One can easily check the "doubling" property $\varepsilon(k t) \leq k \varepsilon(t)(\forall t>0, \forall k \geq 1)$ that we shall often use below (without remarks). Fix (say, maximal) $r_{0}=r_{0}(\varepsilon) \in(0,1]$ with condition $\varepsilon\left(r_{0}\right) \leq 1 / 8$. Take any $\mathbf{a} \in S$. Rotating and shifting the initial coordinate system we can assume that $\mathbf{a}=\mathbf{0}, \mathbf{n}_{\mathbf{0}}^{i}=\{0, \ldots, 0,1\}$ (so that $D$ is "above" $\mathbf{0}$ ), and
find $r \in\left(0, r_{0}\right]$ and a function $\varphi\left(\mathbf{x}^{\prime}\right)$ (we set $\left.\mathbf{x}=\left(\mathbf{x}^{\prime}, x_{N}\right), \mathbf{x}^{\prime}=\left(x_{1}, \ldots, x_{N-1}\right)\right)$ such that $\varphi \in C^{1}\left(\left|\mathbf{x}^{\prime}\right| \leq r\right), \varphi\left(\mathbf{0}^{\prime}\right)=0, \nabla \varphi\left(\mathbf{0}^{\prime}\right)=\mathbf{0}^{\prime},\left|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right| \leq 1 / 4$ for $\left|\mathbf{x}^{\prime}\right| \leq r$ and for $Q_{r}=\left\{\left|\mathbf{x}^{\prime}\right| \leq r,\left|x_{N}\right| \leq r\right\}$ one has

$$
\begin{equation*}
Q_{r} \cap S=\left\{\left(\mathbf{x}, \varphi\left(\mathbf{x}^{\prime}\right)\right),\left|\mathbf{x}^{\prime}\right| \leq r\right\} \tag{2.4}
\end{equation*}
$$

Take $\mathbf{x}=\left(\mathbf{x}^{\prime}, \varphi\left(\mathbf{x}^{\prime}\right)\right),\left|\mathbf{x}^{\prime}\right|<r$, so that $\mathbf{n}_{\mathbf{x}}^{i}=\left\{-\nabla \varphi\left(\mathrm{x}^{\prime}\right), 1\right\} / \sqrt{1+\left|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right|^{2}}$. Then, using (1.2) for the taken $\mathbf{x}$ and for $\mathbf{y}=\mathbf{a}=\mathbf{0}$, we see that for all $\mathbf{x}^{\prime},\left|\mathbf{x}^{\prime}\right|<r$,

$$
\begin{align*}
& \left|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right| \leq 2 \varepsilon\left(\left|\mathbf{x}^{\prime}\right|\right), \\
& \left|\varphi\left(\mathbf{x}^{\prime}\right)\right| \leq 2 \varepsilon\left(\left|\mathbf{x}^{\prime}\right|\right)\left|\mathbf{x}^{\prime}\right|, \tag{2.5}
\end{align*}
$$

which show that in the last considerations we can take $r=r_{0}$. Put $Q_{0}=Q_{r_{0}}$.
By (2.3) and Lebesgue's convergence theorem, since $\partial \Phi(\mathbf{x}) / \partial x_{n}=x_{n} /\left(\sigma_{N}|\mathbf{x}|^{N}\right)$, one has

$$
\begin{aligned}
h_{i}(\mathbf{0})-h_{o}(\mathbf{0}) & =\lim _{\delta \rightarrow 0} \int_{S} \frac{\Phi\left(\delta \mathbf{n}_{\mathbf{0}}^{i}-\mathbf{x}\right)-( \pm \Phi(-\mathbf{x}))-\Phi\left(-\delta \mathbf{n}_{\mathbf{0}}^{i}-\mathbf{x}\right)}{\delta} h(\mathbf{x}) d \sigma_{\mathbf{x}}= \\
& =-\int_{S \cap Q_{\mathbf{0}}} \frac{2 \varphi\left(\mathbf{x}^{\prime}\right)}{\sigma_{N}|\mathbf{x}|^{N}} h(\mathbf{x}) d \sigma_{\mathbf{x}}-\int_{S \backslash Q_{\mathbf{0}}} 2 \frac{\partial \Phi(\mathbf{x})}{\partial x_{N}} h(\mathbf{x}) d \sigma_{\mathbf{x}}
\end{aligned}
$$

so that, by (2.4) and (2.5),

$$
\begin{gather*}
\left|h_{i}(\mathbf{0})-h_{o}(\mathbf{0})\right| \leq \frac{5}{\sigma_{N}} \int_{\left|\mathbf{x}^{\prime}\right| \leq r_{0}} \frac{\varepsilon\left(\left|\mathbf{x}^{\prime}\right|\right)}{\left.\left|\mathbf{x}^{\prime}\right|\right|^{N-1}} h\left(\mathbf{x}^{\prime}, \varphi\left(\mathbf{x}^{\prime}\right)\right) d \mathbf{x}^{\prime}+\frac{2}{\sigma_{N}}\|h\|_{S \backslash Q_{\mathbf{0}}} \int_{S \backslash Q_{\mathbf{0}}} \frac{d \sigma(x)}{|\mathbf{x}|^{N-1}} \leq \\
\leq A_{1}\|h\|_{Q_{0} \cap S} \int_{0}^{r_{0}} \frac{\varepsilon(t)}{t} d t+A_{2}\|h\|_{S \backslash Q_{0}} \tag{2.6}
\end{gather*}
$$

where $A_{1}=5 \sigma_{N-1} / \sigma_{N}$ and $A_{2} \leq A_{N} d / r_{0}$. The first integral in (2.6) is estimated using spherical coordinates in $\mathbb{R}_{\mathbf{x}^{\prime}}^{N-1}$ (the case $N \geq 3$, or just put $\sigma_{1}=2$ if $N=2$ ):

$$
\int_{B\left(\mathbf{0}^{\prime}, r\right)} f\left(\left|\mathbf{x}^{\prime}\right|\right) d \mathbf{x}^{\prime}=\sigma_{N-1} \int_{0}^{r} f(t) t^{N-2} d t
$$

The second integral (that is, $A_{2}$ ) in (2.6) is estimated in (4.11) below (Section 4).
By (1.1), take maximal $r_{1}=r_{1}(\varepsilon) \in\left(0, r_{0}\right]$ with the property $A_{1} \int_{0}^{r_{1}}(\varepsilon(t) / t) d t \leq 1 / 2$.
So, finally, we have for each $\mathbf{a} \in S$ (using (2.6) for $r_{1}$ instead of $r_{0}$ as we clearly can):

$$
\left|h_{i}(\mathbf{a})-h_{o}(\mathbf{a})\right| \leq \frac{1}{2}\|h\|_{S \cap B\left(\mathbf{a}, 2 r_{1}\right)}+A_{3}\|h\|_{S \backslash B\left(\mathbf{a}, r_{1}\right)} .
$$

From this one immediately obtains (for each $\mathbf{a} \in S$ ):

$$
\begin{equation*}
\left|h_{o}(\mathbf{a})\right| \leq \frac{1}{2}\left\|h_{o}\right\|_{S \cap B\left(\mathbf{a}, r_{1}\right)}+A_{4}\left(\left\|h_{o}\right\|_{S \backslash B\left(\mathbf{a}, r_{1}\right)}+\left\|h_{i}\right\|_{S}\right), \tag{2.7}
\end{equation*}
$$

which is the mentioned above a priori estimate for $h_{o}$ (here $A_{4} \leq A_{N} d / r_{1}$ ).
It is worth mentioning that the case $u_{i} \equiv 1$ (so that $h_{i} \equiv 0$ ), $u_{o}=1-w$ (see Theorem W1 (3)), shows that (2.7) does not imply the estimate $\left\|h_{o}\right\|_{S} \leq A\left\|h_{i}\right\|_{S}$, and it is in fact not so simple to obtain the desired estimate $\left\|h_{o}\right\|_{S} \leq A\left\|u_{i}\right\|_{1, S}$ from (2.7). We continue the proof of Theorem 1 by using localization arguments [10], [8].

For the rest of the proof we explicitly consider the case $N \geq 3$ (for $N=2$ one should use (and estimate) the norm $\|\nabla f\|+\|f\|_{B(\mathbf{0}, d+1)}$ instead of $\left.\|f\|_{1}\right)$. We can assume that $\mathbf{0} \in \bar{D}$, so that $B(\mathbf{0}, d)$ contains $\bar{D}$. By definition of $\left\|u_{i}\right\|_{1, \bar{D}}$ we can find $U \in C^{1}\left(\mathbb{R}^{N}\right)$, $\left.U\right|_{\bar{D}}=u_{i}, \operatorname{Supp} U \subset B(0, d+1)$ and $\|U\|_{1} \leq 3\left\|u_{i}\right\|_{1, \bar{D}}$. Let, for short, $m=\left\|u_{i}\right\|_{1, \bar{D}}$.

Suppose that $M=\max _{\mathbf{x} \in S}\left|h_{o}(\mathbf{x})\right|$ is attained at some point $\mathbf{b}=\mathbf{b}_{0} \in S$. Take $B_{0}=B\left(\mathbf{b}, r_{1} / 8\right), \varphi_{0} \in C_{0}^{\infty}\left(B_{0}\right), \varphi_{0}=1$ on $B\left(\mathbf{b}, r_{1} / 16\right), 0 \leq \varphi_{0} \leq 1,\left\|\Delta \varphi_{0}\right\| \leq A_{N} / r_{1}^{2}$. We also can find points $\mathbf{b}_{j} \in \mathbb{R}^{N}, j=1, \ldots, J$, and $\varphi_{j} \in C_{0}^{\infty}\left(B_{j}\right), B_{j}=B\left(\mathbf{b}_{j}, r_{1} / 64\right)$, such that $0 \leq \varphi_{j} \leq 1,\left\|\Delta \varphi_{j}\right\| \leq A_{N} / r_{1}^{2}$ and $\sum_{j=0}^{J} \varphi_{j}=1$ on $B(\mathbf{0}, d+1)$. Clearly, we also can assume that $J$ depends only on $N, r_{1}$ and $d$, that $B_{j} \cap B(\mathbf{0}, d+1) \neq \emptyset$, but $B_{j} \cap B\left(\mathbf{b}, r_{1} / 16\right)=\emptyset$ for $j \geq 1$.

We now have:

$$
U=\Phi * \Delta U=\Phi *\left(\sum_{j=0}^{J} \varphi_{j} \Delta U\right)=\sum_{j=0}^{J} U_{j}
$$

where $U_{j}=\Phi *\left(\varphi_{j} \Delta U\right)$. By $\left[8\right.$, Lemms 4.1] we have $\left\|\nabla U_{j}\right\| \leq A_{N}\|\nabla U\|$. Therefore (since $U_{j}(\infty)=0$ ), we have for all $j=0, \ldots, J$ :

$$
\begin{equation*}
\left\|U_{j}\right\|_{1} \leq A_{5} m, A_{5}=A_{5}(N) \tag{2.8}
\end{equation*}
$$

$U_{j} \in H\left(\mathbb{R}^{N} \backslash \overline{B_{j}}\right) \cap H(D)$, so that (using formula $U_{j}=\Phi * \Delta U_{j}$ ) and integration by parts, we get

$$
\begin{equation*}
\left\|U_{j}\right\|_{2, E_{j}^{2}} \leq A_{6} m, \quad A_{6} \leq A_{N} / r_{1} \tag{2.9}
\end{equation*}
$$

where for $k>0$ we set $E_{j}^{k}=\mathbb{R}^{N} \backslash B\left(\mathbf{b}_{j}, k r_{1} / 64\right), j=1, \ldots, J$, and $E_{0}^{k}=\mathbb{R}^{N} \backslash B\left(\mathbf{b}_{0}, k r_{1} / 8\right)$.
Set $u_{i j}=U_{j} \mid \bar{D}$ and define $h_{i j}, u_{o j}$ and $h_{o j}$ by $u_{i j}$ the same way as $h_{i}, u_{o}$ and $h_{o}$ by $u_{i}$. We have $u_{i(o)}=\sum_{j=0}^{J} u_{i(o) j}$ and $h_{i(o)}=\sum_{j=0}^{J} h_{i(o) j}$, as well as (by (2.8)):

$$
\begin{equation*}
\left\|h_{i j}\right\|_{S} \leq\left\|u_{i j}\right\|_{1, \bar{D}} \leq\left\|U_{j}\right\|_{1} \leq A_{5} m . \tag{2.10}
\end{equation*}
$$

If $B_{j} \subset D$, then $U_{j} \equiv 0$ and so $u_{i j} \equiv 0$, and we shall assume that $B_{j} \nsubseteq D$ for all $j$. Let $2 B_{j} \equiv B\left(\mathbf{b}_{j}, r_{1} / 32\right), j \neq 0$. If $2 B_{j} \cap \bar{D}=\emptyset$ then (as $S \subset E_{j}^{2}$ ) by (2.9) we have $\left\|u_{i j}\right\|_{2, S}=\left\|U_{j}\right\|_{2, S} \leq A_{6} m$, so that, by (2.2), applied to $\left.u_{i j}\right|_{S}$, we then have

$$
\begin{equation*}
\left\|h_{o j}\right\|_{S} \leq\left\|u_{o j}\right\|_{1, \overline{D_{o}}} \leq A_{0}\left\|u_{i j}\right\|_{2, S} \leq A_{0} A_{6} m=A_{7} m \tag{2.11}
\end{equation*}
$$

Changing, if necessary, the numeration, we can suppose that the indices $j=1, \ldots, I$ $(I \leq J)$ are such that $2 B_{j} \cap S \neq \emptyset\left(\right.$ and $\left.B_{j} \nsubseteq D\right)$.
Lemma 2.1. For each $j=0, \ldots, I$ one has

$$
\begin{equation*}
\left\|h_{o j}\right\|_{E_{j}^{3} \cap S} \leq A_{8} m \tag{2.12}
\end{equation*}
$$

Proof. Since we have (by (2.9)) for any $j$

$$
\left\|u_{i j}\right\|_{2, E_{j}^{2} \cap S} \leq\left\|U_{j}\right\|_{2, E_{j}^{2}} \leq A_{6} m
$$

we can find $v_{i j} \in C^{2}(S)$ such that $v_{i j}=u_{i j}$ on $E_{j}^{2} \cap S$ and

$$
\begin{equation*}
\left\|v_{i j}\right\|_{2, S} \leq 2\left\|u_{i j}\right\|_{2, E_{j}^{2} \cap S} \leq 2 A_{6} m \tag{2.13}
\end{equation*}
$$

Let $w_{i j}=u_{i j}-v_{i j}$, and let $v_{o j}$ (respectively, $w_{o j}$ ) are the solutions of the Dirichlet problem in $D_{o}$ with boundary data $v_{i j}$ (respectively, $w_{i j}$ ). By (2.13) and (2.1) we have

$$
\left\|\frac{\partial v_{o j}}{\partial \mathbf{n}_{\mathbf{x}}^{o}}\right\|_{S} \leq\left\|v_{o j}\right\|_{1, \overline{D_{o}}} \leq 2 A_{0} A_{6} m
$$

Since $w_{i j}=0$ on $E_{j}^{2} \cap S$ and $\left\|w_{o j}\right\|_{\overline{D_{o}}} \leq A_{6} m$, by Theorem W1 (2) (applied to $\psi=\left.w_{i j}\right|_{S}$ and $r=r_{1} / 16$ ) one has

$$
\left\|\frac{\partial w_{o j}}{\partial \mathbf{n}_{\mathbf{x}}^{o}}\right\|_{E_{j}^{3} \cap S} \leq \frac{64 A_{0}}{r_{1}} \log \left(\frac{d}{r_{1}}\right)\left\|w_{o j}\right\|_{\overline{D_{o}}} \leq \frac{256 A_{0} A_{6}}{r_{1}} \log \left(\frac{d}{r_{1}}\right) m
$$

which gives (2.12).
Now, by (2.11) and (2.12), since $b \in E_{j}^{3}$ for all $j \neq 0$, we get

$$
\begin{align*}
&\left|\sum_{j=1}^{J} h_{o j}(\mathbf{b})\right| \leq A_{9} m  \tag{2.14}\\
&\left\|h_{o 0}\right\|_{E_{0}^{3} \cap S} \leq A_{8} m \tag{2.15}
\end{align*}
$$

We can suppose that $A_{8} \leq A_{9}$. Also assume that $M \geq 2 A_{9} m$, otherwise Theorem 1 is proved. By (2.14) it follows that $\left|h_{o 0}(\mathbf{b})\right| \geq M / 2$, and by (2.15) we can see that $\left|h_{o 0}(\mathbf{x})\right|$ attains it's maximum on $S$ at some point $\mathbf{b}_{*} \in B\left(\mathbf{b}, 3 r_{1} / 8\right) \cap S$. Now, applying (2.7) for $h_{o 0}$ instead of $h_{o}, \mathbf{b}_{*}$ instead of $\mathbf{a}$ and $h_{i 0}$ instead of $h_{i}$, taking into account that $B\left(\mathbf{b}_{*}, r_{1}\right)$ contains $B\left(\mathbf{b}, 3 r_{1} / 8\right)$ (so that $\left\|h_{o 0}\right\|_{S \backslash B\left(\mathbf{b}_{*}, r_{1}\right)} \leq A_{8} m$ ) and applying (2.10), we obtain:

$$
\left|h_{o 0}\left(\mathbf{b}_{*}\right)\right| \leq \frac{1}{2}\left|h_{o 0}\left(\mathbf{b}_{*}\right)\right|+A_{4}\left(A_{8} m+A_{5} m\right),
$$

and we have finally:

$$
M \leq 2\left|h_{o 0}\left(\mathbf{b}_{*}\right)\right| \leq 4 A_{4}\left(A_{8}+A_{5}\right) m
$$

which completes the proof of Theorem 1 with $A=A\left(N, d, r_{1}\right)$.

## Proof of Theorem 2.

Lemma 2.2. Let $D$ be a (L-D) domain with the Dini-function $\varepsilon(\cdot)$ and $\operatorname{diam} D<d$. Then there exist a Dini-type function $\varepsilon_{*}$ with

$$
\varepsilon_{*}(t) \leq A_{N}\left(t / r_{0}+\varepsilon(t)\right)
$$

a neighborhood $\Omega$ of $S=\partial D$ and a function $E \in C_{0}^{1}\left(\mathbb{R}^{N}\right)$ such that $\|E\|_{1} \leq A_{N}, E \equiv 0$ on $S,|\nabla E(\mathbf{x})| \geq 1$ for all $\mathbf{x} \in \bar{\Omega}, E>0$ in $\Omega \cap D(E \geq 0$ in $D), E<0$ in $\Omega \backslash \bar{D}(E \leq 0$ in $D_{o}$ ), and

$$
|\nabla E(\mathbf{x})-\nabla E(\mathbf{y})| \leq \varepsilon_{*}(|\mathbf{x}-\mathbf{y}|)
$$

for all $\mathbf{x}$ and $\mathbf{y}$ in $\mathbb{R}^{N}$.

Proof. Fix any $\mathbf{a} \in S$ and consider the corresponding $r_{0}, Q_{\mathbf{a}}$ and $\varphi_{\mathbf{a}}$ as in the proof of Theorem 1. Recall that after rotating and shifting the initial coordinate system we obtain the new coordinate system (again denoted by $\mathbf{0}_{\mathbf{x}}$ ) and the corresponding objects translate as follows: $\mathbf{a} \rightarrow \mathbf{0}, Q_{\mathbf{a}} \rightarrow Q_{\mathbf{0}}=\left\{\left|\mathbf{x}^{\prime}\right| \leq r_{0},\left|x_{N}\right| \leq r_{0}\right\}, \varphi_{\mathbf{a}} \rightarrow \varphi=\varphi_{\mathbf{0}}$ so that $S \cap Q_{\mathbf{0}}=\left\{\left(\mathbf{x}^{\prime}, \varphi\left(\mathbf{x}^{\prime}\right)\right),\left|\mathbf{x}^{\prime}\right| \leq r_{0}\right\}, \bar{D} \cap Q_{\mathbf{0}}=\left\{\left|\mathbf{x}^{\prime}\right| \leq r_{0}, \varphi\left(\mathbf{x}^{\prime}\right) \leq x_{N} \leq r_{0}\right\}$, where $\varphi \in C^{1}\left(\left\{\left|\mathbf{x}^{\prime}\right| \leq r_{0}\right\}\right), \varphi\left(\mathbf{0}^{\prime}\right)=0, \nabla \varphi\left(\mathbf{0}^{\prime}\right)=\mathbf{0}^{\prime},\left\|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right\|_{\left\{\left|\mathbf{x}^{\prime}\right| \leq r_{0}\right\}} \leq 1 / 4$.

Now, from (1.2) we need to obtain some more than (2.5). Concretely, for all $\mathbf{x}^{\prime}$ and $\mathbf{y}^{\prime}$ with $\left|\mathbf{x}^{\prime}\right| \leq r_{0},\left|\mathbf{y}^{\prime}\right| \leq r_{0}$ we have

$$
\begin{gathered}
\left|\mathbf{n}_{\left(\mathbf{x}^{\prime}, \varphi\left(\mathbf{x}^{\prime}\right)\right)}^{i}-\mathbf{n}_{\left(\mathbf{y}^{\prime}, \varphi\left(\mathbf{y}^{\prime}\right)\right)}^{i}\right|=\left|\frac{\left(-\nabla \varphi\left(\mathbf{y}^{\prime}\right), 1\right)}{\sqrt{1+\left|\nabla \varphi\left(\mathbf{y}^{\prime}\right)\right|^{2}}}-\frac{\left(-\nabla \varphi\left(\mathbf{x}^{\prime}\right), 1\right)}{\sqrt{1+\left|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right|^{2}}}\right| \leq \\
\leq \varepsilon\left(\left|\left(\mathbf{x}^{\prime}-\mathbf{y}^{\prime}, \varphi\left(\mathbf{x}^{\prime}\right)-\varphi\left(\mathbf{y}^{\prime}\right)\right)\right|\right) \leq 5 / 4 \varepsilon\left(\left|\mathbf{x}^{\prime}-\mathbf{y}^{\prime}\right|\right)
\end{gathered}
$$

so that $\left|1 / \sqrt{1+\left|\nabla \varphi\left(\mathbf{y}^{\prime}\right)\right|^{2}}-1 / \sqrt{1+\left|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right|^{2}}\right| \leq 5 / 4 \varepsilon\left(\left|\mathbf{x}^{\prime}-\mathbf{y}^{\prime}\right|\right)$.
Therefore,

$$
\frac{\left|\nabla \varphi\left(\mathbf{y}^{\prime}\right)-\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right|}{\sqrt{1+\left|\nabla \varphi\left(\mathbf{y}^{\prime}\right)\right|^{2}}} \leq 5 / 4 \varepsilon\left(\left|\mathbf{x}^{\prime}-\mathbf{y}^{\prime}\right|\right)+\left|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right| 5 / 4 \varepsilon\left(\left|\mathbf{x}^{\prime}-\mathbf{y}^{\prime}\right|\right) \leq 25 / 16 \varepsilon\left(\left|\mathbf{x}^{\prime}-\mathbf{y}^{\prime}\right|\right)
$$

and hence

$$
\left|\nabla \varphi\left(\mathbf{y}^{\prime}\right)-\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right| \leq 2 \varepsilon\left(\left|\mathbf{x}^{\prime}-\mathbf{y}^{\prime}\right|\right)
$$

$\left|\mathbf{x}^{\prime}\right| \leq r_{0},\left|\mathbf{y}^{\prime}\right| \leq r_{0}$.
Fix now a function $\chi$ with the following properties: $\chi \equiv 0$ outside $Q_{\mathbf{0}}, 0<\chi \leq 2$ inside $Q_{\mathbf{0}}^{\circ}, \chi=2$ on $Q_{\mathbf{0}}^{\prime}=\left\{\left|\mathbf{x}^{\prime}\right| \leq r_{0} / 2,\left|x_{N}\right| \leq r_{0} / 2\right\}, \chi \in C^{2}\left(\mathbb{R}^{N}\right)$, and $\|\chi\|_{m} \leq A_{N} / r_{0}^{m}$ ( $m=1$ or 2 ). Set

$$
E_{\mathbf{0}}(\mathbf{x})=\chi(\mathbf{x})\left(x_{N}-\varphi\left(\mathbf{x}^{\prime}\right)\right)
$$

so that we have $E_{\mathbf{0}} \in C_{0}^{1}\left(\mathbb{R}^{N}\right)$. Since we have assumed that $\bar{D} \cap Q_{\mathbf{0}}=\left\{\left|\mathbf{x}^{\prime}\right| \leq r_{0}, \varphi\left(\mathbf{x}^{\prime}\right) \leq\right.$ $\left.x_{N} \leq r_{0}\right\}$, we have $E_{\mathbf{0}}(\mathbf{x}) \geq 0$ in $D$ and $E_{\mathbf{0}}>0$ on $D \cap Q_{\mathbf{0}}^{\circ}$. Clearly, $E_{\mathbf{0}}(\mathbf{x}) \equiv 0$ on $S$. We also have

$$
\begin{gathered}
\left.\nabla E_{\mathbf{0}}(\mathbf{x})\right|_{S}=\left.\nabla \chi(\mathbf{x})\left(x_{N}-\varphi\left(\mathbf{x}^{\prime}\right)\right)\right|_{S}+\left.\chi(\mathbf{x})\left\{\left(-\nabla \varphi\left(\mathbf{x}^{\prime}\right), 1\right)\right\}\right|_{S}=\chi(\mathbf{x}) \sqrt{1+\left|\nabla \varphi\left(\mathbf{x}^{\prime}\right)\right|^{2}} \mathbf{n}_{\mathbf{x}}^{i}, \\
\left\|E_{\mathbf{0}}\right\| \leq A_{N} r_{0},\left\|\nabla E_{\mathbf{0}}\right\| \leq A_{N}
\end{gathered}
$$

and $\left|\nabla E_{\mathbf{0}}(\mathbf{x})-\nabla E_{\mathbf{0}}(\mathbf{y})\right| \leq A_{N}\left(|\mathbf{x}-\mathbf{y}| / r_{0}+\varepsilon(|\mathbf{x}-\mathbf{y}|)\right)$, for all $\mathbf{x}$ and $\mathbf{y}$.
Now, denote by $E_{\mathbf{a}}$ the function $E_{\mathbf{0}}$, rewritten in the initial coordinate system, and let $Q_{\mathbf{a}}^{\prime}$ be the cylinder corresponding to $Q_{\mathbf{0}}^{\prime}$.

Finally, choose some covering $\left\{Q_{\mathbf{a}_{s}}^{\prime}\right\}\left(s=1, \ldots, s_{0}\right)$ of $S$ by the cylinders $Q_{\mathbf{a}_{s}}^{\prime}, \mathbf{a}_{s} \in S$ (such that each point x belongs at most to $A_{N}$ of $Q_{\mathbf{a}_{s}}$ ), and consider the corresponding $E_{\mathbf{a}_{s}}$ and $\chi_{\mathbf{a}_{s}}\left(\right.$ that is, $E_{\mathbf{0}}$ and $\chi$ in the initial coordinate system, denoting again $\left.\mathbf{O}_{\mathbf{x}}\right)$. Put

$$
E(\mathbf{x})=\sum_{s=1}^{s_{0}} E_{\mathbf{a}_{s}}(\mathbf{x})
$$

so that $|\nabla E(\mathbf{x})| \geq \sum_{s=1}^{s_{0}} \chi_{\mathbf{a}_{s}}(\mathbf{x}) \geq 2$ on $S$ and

$$
\|E\|_{1} \leq A_{N},|\nabla E(\mathbf{x})-\nabla E(\mathbf{y})| \leq A_{N}\left(|\mathbf{x}-\mathbf{y}| / r_{0}+\varepsilon(|\mathbf{x}-\mathbf{y}|)\right)
$$

The function $E$ and the set $\Omega=\left\{\mathbf{x} \in \mathbb{R}^{N}:|\nabla E(\mathbf{x})|>1\right\}$ give the result.

Corollary 2.3. In the notations of the previous lemma, for all $\delta>0$ small enough, let $D_{\delta}$ be the connected component of the (open) set $\{\mathbf{x} \in \Omega \cup D \mid E(\mathbf{x})>-\delta\}$ that contains $D$. Then $D_{\delta} \rightarrow D$ as $\delta \rightarrow 0$ and (for all small enough $\delta$ ) the $D_{\delta}$ have the same Dini-function, majorized by $\varepsilon_{*}(\cdot)$.

Proof. Clearly, for $\delta$ small enough, we have $S_{\delta}=\partial D_{\delta} \subset\{\mathbf{x} \in \Omega \mid E(\mathbf{x})=-\delta\}$. Take $\mathbf{x}$ and $\mathbf{y}$ on $S_{\delta}$ and let $\mathbf{n}_{\mathbf{x}}^{i \delta}$ be the unit inward normal to $S_{\delta}$ at $\mathbf{x} \in S_{\delta}$ with respect to $D_{\delta}$. Elementary planimetric arguments and Lemma 2.2 show that

$$
\left|\mathbf{n}_{\mathbf{x}}^{i \delta}-\mathbf{n}_{\mathbf{y}}^{i \delta}\right|=\left|\frac{\nabla E(\mathbf{x})}{|\nabla E(\mathbf{x})|}-\frac{\nabla E(\mathbf{y})}{|\nabla E(\mathbf{y})|}\right| \leq|\nabla E(\mathbf{x})-\nabla E(\mathbf{y})| \leq \varepsilon_{*}(|\mathbf{x}-\mathbf{y}|)
$$

since $\inf _{S_{\delta}}|\nabla E| \geq \inf _{\Omega}|\nabla E| \geq 1$.
Now we continue the proof of Theorem 2 for $N>2$ (the case $N=2$ is briefly discused later). Let $u_{i}=u_{1} \in C^{1}(\bar{D}) \cap H(D)$, and put $m=\left\|u_{1}\right\|_{1, \bar{D}}$. Suppose that $u_{p}, p \in \mathbb{N}$, is defined (with $u_{p} \in C^{1}(\bar{D}) \cap H(D)$ and $\left\|u_{p}\right\|_{1, \bar{D}} \leq m / 2^{p-1}$ ). Extend $u_{p}$ by Whitney's theorem to a function $f_{p} \in C_{0}^{1}\left(\mathbb{R}^{N}\right)$ with $\left\|f_{p}\right\|_{1} \leq m / 2^{p-2}$. By [8, Corollary 6.3] we can find $g_{p} \in C^{1}\left(\mathbb{R}^{N}\right)$ harmonic on some domain $D_{\delta_{p}}\left(\delta_{p} \in(0,1)\right.$ is small enough, so that $S_{p}=S_{\delta_{p}}$ and $D_{p}=D_{\delta_{p}}$ satisfy Corollary 2.3 with $\delta=\delta_{p}\left(\operatorname{diam} D_{p}<d\right)$ and $\left\|f_{p}-g_{p}\right\|_{1} \leq$ $m / 2^{p}$. Therefore, $\left\|g_{p}\right\|_{1} \leq 5 m / 2^{p}$. Set $u_{p+1}=\left.\left(f_{p}-g_{p}\right)\right|_{\bar{D}}$. Then $\left\|u_{p+1}\right\|_{1, \bar{D}} \leq m / 2^{p}$, $u_{p+1} \in H(D) \cap C^{1}(\bar{D})$. Since $u_{i}=\left.\sum_{p=1}^{+\infty} g_{p}\right|_{\bar{D}}$ and $\left\|g_{p}\right\|_{1, \bar{D}} \leq\left\|g_{p}\right\|_{1} \leq 5 \mathrm{~m} / 2^{p}$ it is enough to find a function $F_{p} \in C^{1}\left(\mathbb{R}^{N}\right) \cap S H\left(\mathbb{R}^{N}\right)$ such that $\left.F_{p}\right|_{\bar{D}}=\left.g_{p}\right|_{\bar{D}}$ and $\left\|F_{p}\right\|_{1} \leq A\left\|g_{p}\right\|_{1, \bar{D}}$. The desired function $F$ is $\sum_{p=1}^{+\infty} F_{p}$.

So, we have $g_{p} \in C^{1}\left(\overline{D_{p}}\right) \cap H\left(D_{p}\right)$. Put $m_{p}=\left\|g_{p}\right\|_{1, \overline{D_{p}}} \leq\left\|g_{p}\right\|_{1} \leq 5 m / 2^{p}$. Since $\bar{D}$ has connected complement, we also can assume that $\overline{D_{p}}$ has connected complement $\Omega_{p}$. By Theorem 1 there exists a function $h_{p} \in C^{1}\left(\overline{\Omega_{p}}\right) \cap H\left(\Omega_{p}\right), h_{p}(\infty)=0$, such that $h_{p}=g_{p}$ on $S_{p}=\partial \Omega_{p}$ and

$$
\left\|h_{p}\right\|_{1, \overline{\Omega_{p}}} \leq A_{10} m_{p}
$$

Here $A_{10}$ depends only on $N, \varepsilon$ and $d$ (because all the domains $D_{p}$, by Corollary 2.3, have the same Dini function, majorized by $\varepsilon_{*}(\cdot)$, and their diameters are less than $d$ ). Applying Theorem W1 (3) for $\Omega_{p}$, take the function $w_{p} \in H\left(\Omega_{p}\right) \cap C^{1}\left(\overline{\Omega_{p}}\right)$, $w_{p}=0$ on $S_{p}$, $w_{p}(\infty)=1$, with $\left\|w_{p}\right\|_{1, \overline{\Omega_{p}}} \leq A_{11}$ (the last can be checked by Theorem 1 applied to the functions $u_{i} \equiv-\left.1\right|_{\overline{D_{p}}}$ and $\left.u_{o}=w_{p}-1\right)$ and

$$
\left.\frac{\partial w_{p}}{\partial \mathbf{n}_{\mathbf{x}}^{p}}\right|_{S_{p}} \geq A_{0}^{-1}>0, \quad \forall \mathbf{x} \in S_{p}
$$

Here $\mathbf{n}_{\mathbf{x}}^{p}$ is the inward unit normal to $S_{p}$ at $\mathbf{x} \in S_{p}$ with respect to the domain $\Omega_{p}$. For $t>0$ consider the function $F_{p}^{t}(\mathbf{x})$, which is equal to $g_{p}(\mathbf{x})$ on $\overline{D_{p}}$ and $F_{p}^{t}(\mathbf{x})=h_{p}(\mathbf{x})+t w_{p}(\mathbf{x})$ in $\overline{\Omega_{p}}$.

By (2.2), we have

$$
\Delta F_{p}^{t}=\left.\left(\frac{\partial g_{p}}{\partial \mathbf{n}_{\mathbf{x}}^{i}}+\frac{\partial h_{p}}{\partial \mathbf{n}_{\mathbf{x}}^{p}}+t \frac{\partial w_{p}}{\partial \mathbf{n}_{\mathbf{x}}^{p}}\right)\right|_{S_{p}} \sigma^{p}
$$

in the distributional sense (here $\mathbf{n}_{\mathrm{x}}^{i}=-\mathbf{n}_{\mathrm{x}}^{p}$ and $\sigma^{p}$ is the surface measure on $S_{p}$ ).
Therefore, for $t=t_{*}=\left(1+A_{10}\right) A_{0} m_{p}$ we have $F_{p}^{*}=F_{p}^{t_{*}} \in S H\left(\mathbb{R}^{N}\right) \cap \operatorname{Lip}\left(\mathbb{R}^{N}\right)$ and $\left\|F_{p}^{*}\right\|_{L i p_{1}} \leq A_{12} m_{p}$.

Final step. Regularization. Fix $\chi_{1} \in C_{0}^{\infty}(B(\mathbf{0}, 1)), \chi_{1} \geq 0, \chi_{1}(\mathbf{x})=\chi_{1}(|\mathbf{x}|)$, $\int_{B(0,1)} \chi_{1}(\mathbf{x}) d \mathbf{x}=1$, and let $\chi_{\tau}(\mathbf{x})=\chi_{1}(\mathbf{x} / \tau) / \tau^{N}, \tau>0$. Put $d_{p}=\operatorname{dist}\left(S, S_{p}\right)$, then, for any $\tau \in\left(0, d_{p}\right)$ one can take

$$
F_{p}=\chi_{\tau} * F_{p}^{*} .
$$

In fact, it is easily seen that $F_{p} \in C^{1}\left(\mathbb{R}^{N}\right)$ and $\left\|F_{p}\right\|_{1} \leq A_{N}\left\|F_{p}^{*}\right\|_{L i p_{1}} \leq A m_{p}$. By the meanvalue theorem for harmonic functions (taking into account that $\chi_{\tau}$ is radial and $\int \chi_{\tau}(\mathbf{x}) d \mathbf{x}=1$ ) we have $F_{p}=F_{p}^{*}=g_{p}$ on $\bar{G}$. And we get (1.4) for $N \geq 3$.

For $N=2$ the only difference in the proof is that we take, instead of $w$ (from Theorem W1 (3)), the function $w_{*}$ with the properties $w_{*} \in H\left(D_{o}\right),\left.w_{*}\right|_{S}=0$ and $w_{*}(\mathbf{x}) /(\log |\mathbf{x}|) \rightarrow$ 1 as $|\mathbf{x}| \rightarrow 0$. Use Theorem 4.9 and the reflection $z \rightarrow 1 / \bar{z}, z \in \mathbb{C}$.

Theorem 2 is proved.
Proof of Corollary 1. We can find open balls $B_{j}(j=1, \ldots, J)$ and $\varphi_{j} \in C_{0}^{\infty}\left(B_{j}\right)$ with the following properties: $\sum_{j=1}^{J} \varphi_{j}(\mathrm{x})=1$ on $\bar{D}$ and for each $j$ either $\overline{B_{j}} \subset D$ or there exists $\mathbf{a}_{j} \in \partial D$ such that $\overline{B_{j}} \subset B_{\mathbf{a}_{j}}$. If $j$ is such that $\overline{B_{j}} \subset D$ we define $f_{j}=\Phi *\left(\varphi_{j} \Delta f\right)$. In case $B_{j} \nsubseteq D$ we choose some $\mathbf{a}_{j}$, the corresponding $B_{\mathbf{a}_{j}}$ and $g_{\mathbf{a}_{j}}$, and set $f_{j}=\Phi *\left(\varphi_{j} \Delta g_{\mathbf{a}_{j}}\right)$. By [8, Lemma 4.2] we have $f_{j} \in C^{1}\left(\mathbb{R}^{N}\right)\left(f_{j} \in C_{l o c}^{1}\left(\mathbb{R}^{N}\right)\right.$ for $\left.N=2\right)$ and $\Delta f_{j}=\varphi_{j} \Delta f \geq 0$ or $\Delta f_{j}=\varphi_{j} \Delta g_{\mathbf{a}_{j}} \geq 0$ (in the distributional sense), so that $f_{j} \in S H\left(\mathbb{R}^{N}\right)$. Take $F_{0}=$ $\sum_{j=1}^{J} f_{j} \in C_{(l o c)}^{1}\left(\mathbb{R}^{N}\right) \cap S H\left(\mathbb{R}^{N}\right)$ and consider $u_{i}=\left.\left(f-F_{0}\right)\right|_{D}$. Since $g_{\mathbf{a}_{j}}=f$ in $B_{\mathbf{a}_{j}} \cap D$ we have

$$
\Delta u_{i}=\Delta f-\sum_{j=1}^{J} \varphi_{j} \Delta f=0
$$

in $D$, which gives $u_{i} \in H(D) \cap C^{1}(\bar{D})$. Extend $u_{i}$ by Theorem 2 to a function $F_{1} \in$ $C_{(l o c)}^{1}\left(\mathbb{R}^{N}\right) \cap S H\left(\mathbb{R}^{N}\right)$. The function $F=F_{0}+F_{1}$ gives the result.

Notice, that Corollary 1 can be reformulated for the "entire" class $S H(D) \cap C^{1}(\bar{D})$ in (L-D) domains $D$ by analogy with [3, Corollary 2.6] .

## 3 Proof of Theorem 3

In what follows the constants $A, A_{1}, \ldots$ (depending only on $N, \varepsilon, d$ ) and $A_{N}$ (depending only on $N$ ) can be different from the corresponding above ones and even can change from one formula to others. We need the following extension of Theorem 1.
Theorem 3.1. Let $D$ be a (L-D) domain in $\mathbb{R}^{N}$ with diam $D<d$ and the Dini-function $\varepsilon(\cdot)$ satisfying the Log-Dini property

$$
\begin{equation*}
\int_{0}^{1} \frac{\varepsilon(t)}{t} \log \left(\frac{1}{t}\right) d t<+\infty \tag{3.1}
\end{equation*}
$$

Let $\psi \in C^{1}(S), S=\partial D$, and $u_{i}$ (respectively, $u_{o}$ ) be the solution of the Dirichlet problem in $D$ (respectively, in $D_{o}=\mathbb{R}^{N} \backslash \bar{D}$ ) with the boundary data $\psi$. Let $\mathbf{z} \in D$ and $\mathbf{a} \in S$ be (one of) the closest points to $\mathbf{z}$ on $S$. Assume that $|\mathbf{z}-\mathbf{a}|=\operatorname{dist}(\mathbf{z}, S)<r_{\mathbf{0}} / 2$, and take $\mathbf{z}_{\mathbf{a}}^{*} \in D_{o}$ such that $\mathbf{z}-\mathbf{a}=-\left(\mathbf{z}_{\mathbf{a}}^{*}-\mathbf{a}\right)$. Then

$$
\begin{equation*}
\left|\nabla u_{i}(\mathbf{z})-\left(\nabla u_{o}\left(\mathbf{z}_{\mathbf{a}}^{*}\right)\right)_{\mathbf{a}}^{*}\right| \leq A\|\psi\|_{1, S}, \tag{3.2}
\end{equation*}
$$

where $(\cdot)_{\mathbf{a}}^{*}$ means symmetry with respect to the hyperplane $P_{\mathbf{a}}$ tangent to $S$ at the point $\mathbf{a} \in S$.

Remark 3.2. The functions $\varepsilon_{p}(t)=1 /(\log (1 / t))^{p}\left(0<t<e^{-p-1}\right), \varepsilon(t)=\varepsilon\left(e^{-p-1}\right)$ ( $t \geq e^{-p-1}$ ), do satisfy (3.1) if and only if $p>2$.

The functions $\varepsilon(t)=t^{\alpha}$ satisfy (3.1) for each $\alpha \in(0,1]$.
First we prove the following Lemma. Put $m=\|\psi\|_{1, S}$.
Lemma 3.3. In the notations of Theorem 3.1, let $\mathbf{b} \in S$ and $\mathbf{x} \in D$ (respectively, $\mathbf{x} \in D_{o}$ ) be such that $|\mathbf{x}-\mathbf{b}|<r_{0} / 2$ and the angle between $\mathbf{x}-\mathbf{b}$ and $\mathbf{n}_{\mathbf{b}}^{i}$ (respectively, $\mathbf{n}_{\mathbf{b}}^{o}$ ) be less than $\pi / 6$. Then

$$
\begin{equation*}
\left|u_{i(o)}(\mathbf{x})-u_{i(o)}(\mathbf{b})\right| \leq A m|\mathbf{x}-\mathbf{b}| \log \frac{1}{|\mathbf{x}-\mathbf{b}|} \tag{3.3}
\end{equation*}
$$

The Example 4.1 (see also (4.1)) shows that the last estimate is "almost" precise.
Proof. Denote by $G(\mathbf{x}, \mathbf{y})$ the Green function of the domain $D$. Recall that (in our choice) $G(\mathbf{x}, \mathbf{y})=\Phi(\mathbf{x}-\mathbf{y})-v_{\mathbf{x}}(\mathbf{y})$, where $\Phi$ is mentioned above (standard) fundamental solution for the Laplacean $\Delta$, and the function $v_{\mathbf{x}}(\mathbf{y})$ is harmonic with respect to $\mathbf{y}$ in $D$, and having the boundary data $v_{\mathbf{x}}(\mathbf{y})=\Phi(\mathbf{y}-\mathbf{x}), \mathbf{y} \in S$. In what follows $\rho(\mathbf{x})$ means the distance from $\mathbf{x}$ to $S$.
Theorem W2. In the present notations, $G(\mathbf{x}, \mathbf{y}) \in C^{1}(\bar{D} \backslash\{\mathbf{x}\})$ ( $\mathbf{x}$ being fixed), and the Green function $G$ of $D$ satisfies the following properties:

$$
\begin{gather*}
\left|\frac{\partial G(\mathbf{x}, \mathbf{y})}{\partial y_{n}}\right| \leq \frac{A \rho(\mathbf{x})}{|\mathbf{x}-\mathbf{y}|^{N}}, \quad 1 \leq n \leq N  \tag{3.4}\\
\left|\frac{\partial}{\partial x_{n}} \frac{\partial}{\partial y_{l}} G(\mathbf{x}, \mathbf{y})\right| \leq \frac{A}{|\mathbf{x}-\mathbf{y}|^{N}}, \quad 1 \leq n \leq N, 1 \leq l \leq N \tag{3.5}
\end{gather*}
$$

where $A=A(N, d, \varepsilon)$.
The same estimates hold for the Green functions of (and in) bounded components of $D_{o}$. For the unbounded component $D_{*}$ of $D_{o}$, the last estimates hold also for the Green function $G_{*}$ of $D_{*}($ in place of $G)$ for all $\mathbf{y} \in B(\mathbf{0}, 2 d) \cap D_{*}$ (presumably, $\mathbf{0} \in \bar{D}$ ) and all $\mathrm{x} \in D_{*}$.

The proof of this theorem (similar to that of [7, Theorem 2.3]) is given in Section 4 (see Theorem 4.5).

The next formula is well known [11, Theorem 12.1] (it directly follows from the GaussOstrogradski formula and then clearly holds for (L-D) domains):

$$
\begin{equation*}
u_{i}(\mathbf{x})=-\int_{S} \frac{\partial G(\mathbf{x}, \mathbf{y})}{\partial \mathbf{n}_{\mathbf{y}}^{i}} \psi(\mathbf{y}) d \sigma_{\mathbf{y}} \tag{3.6}
\end{equation*}
$$

We can suppose that $\mathbf{b}=0$ and $\mathbf{n}_{0}^{i}=(0, \ldots, 0,1)$, so that by (3.4) and (3.6) one has (for $\left.\mathbf{y}=\left(\mathbf{y}^{\prime}, y_{N}\right)\right)$ :

$$
\begin{gathered}
\left|u_{i}(\mathbf{x})-u_{i}(\mathbf{0})\right| \leq \int_{S}\left|\frac{\partial G(\mathbf{x}, \mathbf{y})}{\partial \mathbf{n}_{\mathbf{y}}^{i}}\right||\psi(\mathbf{y})-\psi(\mathbf{0})| d \sigma_{\mathbf{y}} \leq A_{1} \int_{S} \frac{\rho(\mathbf{x})}{|\mathbf{x}-\mathbf{y}|^{N}} m|\mathbf{y}| d \sigma_{\mathbf{y}} \leq \\
\quad \leq A_{2}\left(\int_{S \backslash Q_{\mathbf{0}}} \frac{x_{N}}{|\mathbf{x}-\mathbf{y}|^{N}} m|\mathbf{y}| d \sigma_{\mathbf{y}}+\int_{S \cap Q_{\mathbf{0}}} \frac{x_{N}}{\left(\left|\mathbf{y}^{\prime}\right|^{2}+x_{N}^{2}\right)^{N / 2}} m\left|\mathbf{y}^{\prime}\right| d \mathbf{y}^{\prime}\right) \leq
\end{gathered}
$$

$$
\leq A_{3} m x_{N}+A_{3} m \int_{0}^{r_{0}} \frac{x_{N}}{\left(r^{2}+x_{N}^{2}\right)^{N / 2}} r^{N-1} d r \leq A m x_{N}\left(1+\log \frac{r_{0}}{x_{N}}\right)
$$

The penultimate integral was estimated using spherical coordinates in the hyperplane $\mathbb{R}_{\mathbf{y}^{\prime}}^{N-1}$.

When $\mathbf{x}$ belongs to the unbounded component of $D_{o}$, it would be enough to additionally apply the so-called Kelvin transform (see (4.21), Section 4). Lemma 3.3 is proved.

Proof of Theorem 3.1. Clearly, we can set $\mathbf{a}=\mathbf{0}, \mathbf{z}=\left(0, \ldots, 0, z_{N}\right), z_{N} \in\left(0, r_{0} / 2\right)$, so that $\mathbf{n}_{\mathbf{0}}^{i}=\{0, \ldots, 0,1\}$.

There exists a domain $D^{\prime} \subseteq D \cap Q_{0}$ with the following properties: $D^{\prime}$ is convex (L-D) domain with Dini-function $A_{N} \varepsilon(\cdot), D^{\prime}$ is radially symmetric with respect to the variable $\mathbf{y}^{\prime}$, and

$$
\begin{gathered}
D^{\prime} \cap\left\{\left(\mathbf{y}^{\prime}, y_{N}\right) \in \mathbb{R}^{N}| | \mathbf{y}^{\prime} \left\lvert\,<\frac{r_{0}}{3}\right.\right\}= \\
\left\{\left(\mathbf{y}^{\prime}, y_{N}\right) \in \mathbb{R}^{N}| | \mathbf{y}^{\prime} \left\lvert\,<\frac{r_{0}}{3}\right., 4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)<y_{N}<r_{0}-4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right\}
\end{gathered}
$$

where $\varphi_{\varepsilon}(r)=\int_{0}^{r} \varepsilon(t) d t$. Notice that $\varepsilon\left(r_{0}\right) \leq 1 / 8$ (see also (2.5)) and $4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right) \geq$ $2\left|\mathbf{y}^{\prime}\right| \varepsilon\left(\left|\mathbf{y}^{\prime}\right|\right) \geq \varphi\left(\mathbf{y}^{\prime}\right)($ since $\varepsilon(t) / t \geq \varepsilon(r) / r$ for $t \in(0, r])$. Let $D_{*}^{\prime}$ be symmetric to $D^{\prime}$ with respect to the hyperplane $P_{\mathbf{0}}=\left\{x_{N}=0\right\}$, so that $D_{*}^{\prime} \subset D_{o} \cap Q_{\mathbf{0}}$, and let $G^{\prime}(\mathbf{x}, \mathbf{y})$ and $G_{*}^{\prime}(\mathbf{x}, \mathbf{y})$ be the Green functions of the domains $D^{\prime}$ and $D_{*}^{\prime}$ respectively. Put $S^{\prime}=\left\{\left(\mathbf{y}^{\prime}, y_{N}\right)| | \mathbf{y}^{\prime} \mid \leq r_{0} / 3, y_{N}=4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right\}, S^{\prime} \subset \partial D^{\prime}$.

By (1.2) we have for $\mathbf{y}=\left(\mathbf{y}^{\prime}, \varphi\left(\mathbf{y}^{\prime}\right)\right) \in S,\left|\mathbf{y}^{\prime}\right| \leq r_{0} / 3$,

$$
\left|\mathbf{n}_{\mathbf{0}}^{i}-\mathbf{n}_{\mathbf{y}}^{i}\right| \leq \varepsilon(|\mathbf{y}|) \leq \varepsilon\left(\sqrt{2} \frac{r_{0}}{3}\right) \leq \varepsilon\left(r_{0}\right) \leq \frac{1}{8}
$$

so that the angle between $\mathbf{n}_{\mathbf{0}}^{i}$ and $\mathbf{n}_{\mathbf{y}}^{i}$ is less than $\pi / 6$ and we can apply (3.3) (for $\mathbf{b}=\mathbf{y}$ ) to obtain

$$
\begin{equation*}
\left|u_{i}\left(\mathbf{y}^{\prime}, 4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right)-( \pm \psi(\mathbf{y}))-u_{o}\left(\mathbf{y}^{\prime},-4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right)\right| \leq A m \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right) \log \frac{1}{\varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)} \tag{3.7}
\end{equation*}
$$

Put $\tilde{\varphi}(r)=\varphi_{\varepsilon}(r) \log \left(1 / \varphi_{\varepsilon}(r)\right), r \in\left(0, r_{0}\right)$. Using (3.6) for $u_{i}$ and $u_{o}$ in $D^{\prime}$ and $D_{*}^{\prime}$ respectively, the property $G^{\prime}(\mathbf{x}, \mathbf{y})=G_{*}^{\prime}(\overline{\mathbf{x}}, \overline{\mathbf{y}})\left(\mathbf{x}, \mathbf{y} \in D, \overline{\mathbf{x}}=\mathbf{x}_{\mathbf{0}}^{*}\right.$ and $\left.\overline{\mathbf{y}}=\mathbf{y}_{\mathbf{0}}^{*}\right)$, (3.5) and (3.7), we obtain:

$$
\begin{gather*}
\left|\nabla u_{i}(\mathbf{z})-\overline{\nabla u_{o}(\overline{\mathbf{z}})}\right|= \\
\left.=\left|\int_{\partial D^{\prime}} \nabla_{\mathbf{x}} \frac{\partial}{\partial \mathbf{n}_{\mathbf{y}}^{i}} G^{\prime}(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}} u_{i}(\mathbf{y}) d \sigma_{\mathbf{y}}-\left.\int_{\partial D_{*}^{\prime}} \overline{\nabla_{\mathbf{x}} \frac{\partial}{\partial \mathbf{n}_{\mathbf{y}}^{i}} G_{*}^{\prime}(\mathbf{x}, \mathbf{y})}\right|_{\mathbf{x}=\overline{\mathbf{z}}} u_{o}(\mathbf{y}) d \sigma_{\mathbf{y}} \right\rvert\,= \\
=\left|\int_{\partial D^{\prime}} \nabla_{\mathbf{x}} \frac{\partial}{\partial \mathbf{n}_{\mathbf{y}}^{i}} G^{\prime}(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}}\left(u_{i}(\mathbf{y})-u_{o}(\overline{\mathbf{y}}) d \sigma_{\mathbf{y}} \mid \leq\right. \\
\leq \int_{\partial D^{\prime} \backslash S^{\prime}} \frac{A_{1}}{|\mathbf{z}-\mathbf{y}|^{N}} 2 m d \sigma_{\mathbf{y}}+\int_{S^{\prime}} \frac{A_{1}}{|\mathbf{z}-\mathbf{y}|^{N}} m \tilde{\varphi}\left(\left|\mathbf{y}^{\prime}\right|\right) d \mathbf{y}^{\prime} \leq \\
\leq A_{2} m+A_{2} m \int_{0}^{r_{0} / 3} \frac{1}{t^{N}} \tilde{\varphi}(t) t^{N-2} d t \leq A m \tag{3.8}
\end{gather*}
$$

by (3.1) and inequalities $t \varepsilon(t) / 2 \leq \varphi_{\varepsilon}(t) \leq t \varepsilon(t), \varepsilon(t) \geq t \varepsilon(1)$.
Again, the penultimate integral in (3.8) is estimated using spherical coordinates in $P_{\mathbf{0}}$.

The following Proposition in fact will not be used in the proof of Theorem 3, but it has it's own interest, and gives a clear understanding that in (3.2) we have to bother about the "normal" derivative $\left.\frac{\partial u_{i}}{\partial \mathbf{n}_{\mathbf{a}}^{i}}\right|_{\mathbf{z}}$.
Proposition 3.4. In conditions of Theorem 3.1, the case $\mathbf{a}=0, \mathbf{z}=\left(0, \ldots, z_{N}\right), z_{N} \in$ ( $0, r_{0} / 2$ ), we have

$$
\left.\left|\frac{\partial u_{i}}{\partial x_{n}}\right|_{\mathbf{x}=\mathbf{z}} \right\rvert\, \leq A\|\psi\|_{1, S}, \quad n \in\{1, \ldots, N-1\} .
$$

By (3.6) and (3.5) it is enough to consider the case when $\psi(\mathbf{x})=0$ outside $Q_{0}$ and for $\left|\mathbf{x}^{\prime}\right|>r_{0} / 3$. Fix $n \in\{1, \ldots, N-1\}$. For $\mathbf{y}=\left(\mathbf{y}^{\prime}, 4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right) \subset{ }_{\sim} S^{\prime}$ define $\tilde{\psi}(\mathbf{y})=$ $\psi\left(\mathbf{y}^{\prime}, \varphi\left(\mathbf{y}^{\prime}\right)\right)$ and set $\tilde{\psi}(\mathbf{y})=0$ on $\partial D^{\prime} \backslash S^{\prime}$, so that $\tilde{\psi} \in C^{1}\left(\partial D^{\prime}\right)$ and $\|\tilde{\psi}\|_{1, \partial D^{\prime}} \leq A m$. Let $\tilde{u}$ be the solution of the Dirichlet problem in $D^{\prime}$ with the boundary data $\tilde{\psi}$. We claim that $\left.\left|\frac{\partial \tilde{u}}{\partial x_{n}}\right|_{\mathbf{x}=\mathbf{z}} \right\rvert\, \leq A m$. Consider the function $\tilde{v}(\mathbf{x})=\tilde{u}\left(x_{1}, \ldots, x_{n-1}, x_{n}, x_{n+1}, \ldots, x_{N}\right)-$ $\tilde{u}\left(x_{1}, \ldots, x_{n-1},-x_{n}, x_{n+1}, \ldots, x_{N}\right)$, so that $\tilde{v} \in H\left(D^{\prime}\right),\left.\tilde{v}\right|_{\left\{x_{n}=0\right\}}=0$ and $\left.\frac{\partial \tilde{v}}{\partial x_{n}}\right|_{\left\{x_{n}=0\right\}}=$ $\left.2 \frac{\partial \tilde{u}}{\partial x_{n}}\right|_{\left\{x_{n}=0\right\}}$. Since $\tilde{\psi} \in C^{1}\left(\partial D^{\prime}\right)$ we have $|\tilde{v}(\mathbf{x})| \leq A m x_{n}$ on $\partial D_{+}^{\prime}$, where $D_{+}^{\prime}=D^{\prime} \cap\left\{x_{n}>\right.$ $0\}$, so that $|\tilde{v}(\mathbf{x})| \leq A m x_{n}$ in $D_{+}^{\prime}$ and the claim follows.

Finally, take $w=u_{i}-\tilde{u}$ in $\overline{D^{\prime}}$. By Lemma 3.3 (with $\mathbf{b}=\left(\mathbf{y}^{\prime}, \varphi\left(\mathbf{y}^{\prime}\right)\right)$ and $\mathbf{x}=\mathbf{y}=$ $\left.\left(\mathbf{y}^{\prime}, 4 \varphi_{\varepsilon}\left(\mathbf{y}^{\prime}\right)\right) \in S^{\prime}\right)$,

$$
|w(\mathbf{y})| \leq A_{1} m 8 \varphi_{\varepsilon}\left(\mathbf{y}^{\prime}\right) \log \frac{1}{8 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)} \leq A m \tilde{\varphi}\left(\left|\mathbf{y}^{\prime}\right|\right)
$$

Clearly, also $|w(\mathbf{y})| \leq A m$ for $\mathbf{y} \in \partial D^{\prime} \backslash S^{\prime}$. By (3.6), the equality

$$
\left.\frac{\partial w}{\partial x_{n}}\right|_{\mathbf{x}=\mathbf{z}}=-\left.\int_{\partial D^{\prime}} \frac{\partial}{\partial x_{n}} \frac{\partial}{\partial \mathbf{n}_{\mathbf{y}}^{i}} G^{\prime}(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}} w(\mathbf{y}) d \sigma_{\mathbf{y}}
$$

and estimates (3.5) end the proof of Proposition 3.4 as in (3.8).
Proof of Theorem 3. Put $M=\|f\|_{1, \bar{D}}$ and $\mu=\left.\Delta f\right|_{D}$. We claim that for each domain $\Omega$, $\Omega \subset D$, with piecewise smooth boundary, one has

$$
\begin{equation*}
\mu(\Omega) \leq M \sigma(\partial \Omega) \tag{3.9}
\end{equation*}
$$

where $\sigma(\cdot)$ is a surface $(N-1)$-dimensional (Lebesque) measure. To prove this it suffices (after reasonable regularization and then passing to the limit) to apply the GaussOstrogradski formula:

$$
\mu(\Omega)=\int_{\Omega} \Delta f(\mathbf{x}) d \mathbf{x}=\int_{\partial \Omega}\left(\nabla f(\mathbf{y}), \mathbf{n}_{\mathbf{y}}^{o}\right) d \sigma_{\mathbf{y}} \leq M \sigma(\partial \Omega) .
$$

Since for each ball $B=B(\mathbf{b}, \delta) \subset D$ we in fact have

$$
\mu(B)=\int_{\partial B}\left(\nabla f(\mathbf{y})-\nabla f(\mathbf{b}), \mathbf{n}_{\mathbf{y}}^{o}\right) d \sigma_{\mathbf{y}} \leq \omega_{\bar{D}}(\nabla f, \delta) \sigma(\partial B)=o\left(\delta^{N-1}\right)
$$

$\left(\omega_{E}(g, \cdot)\right.$ being the modulus of continuity of the (scalar- or vector-) function $g$ on the set $E)$, one can also easily prove that $\mu(\partial \Omega \cap D)=0$ for the $\Omega$ considered.

The idea of the proof of (1.5) is the following. Take $u_{i} \in H(D),\left.u_{i}\right|_{\partial D}=\left.f\right|_{\partial D}$. If $u_{i} \in$ $C^{1}(\bar{D})$ and $\left\|u_{i}\right\|_{1, \bar{D}} \leq A_{1} m$, then it could be possible to prove (1.5) with $A=A\left(A_{1}, N, \varepsilon, d\right)$ (see the end of the proof of Theorem 3 below). But it turns out (see Example 4.1 below) that it is not always $u_{i} \in C^{1}(\bar{D})$.

By Theorem 3.1, the "reflected" harmonic function $u_{o}$ satisfy the property (3.2), and we need also appropriately "reflect" the measure $\mu$ from $D$ to $D_{o}$. The last means that we want to find such positive measure $\mu^{*}$ in $D_{o}$ (for the notations $G, \mathbf{z}, \mathbf{a}, \mathbf{z}_{\mathbf{a}}^{*}$ and $(\cdot)_{\mathbf{a}}^{*}$ see Theorem 3.1, $\left.G_{o}(\mathbf{x}, \mathbf{y})\right)$ is the Green function of the domain $D_{o}$ ) that

$$
\int_{D_{o}} G_{o}(\mathbf{x}, \mathbf{y}) d \mu_{\mathbf{y}}^{*} \in C^{1}\left(D_{o}\right)
$$

and

$$
\begin{equation*}
\left|\int_{D} \nabla_{\mathbf{x}} G(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}} d \mu_{\mathbf{y}}-\left(\left.\int_{D_{o}} \nabla_{\mathbf{x}} G_{o}(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}_{\mathbf{a}}^{*}} d \mu_{\mathbf{y}}^{*}\right)_{\mathbf{a}}^{*} \mid \leq A M \tag{3.10}
\end{equation*}
$$

for all $\mathbf{z} \in D$ with $\rho(\mathbf{z})<r_{0} / 4$. After this we shall have $f_{o}(\mathbf{x})=u_{o}(\mathbf{x})+\int_{D_{o}} G_{o}(\mathbf{x}, \mathbf{y}) d \mu_{\mathbf{y}}^{*} \in$ $C^{1}\left(\overline{D_{o}}\right) \cap S H\left(D_{o}\right), f_{o}=f$ on $S$, and we can terminate the proof essentially as in the proof of Theorem 2.

We pass to the details supposing that $N \geq 3$ (for $N=2$ one can follow the previous notes on this matter).

Let $\left\{B_{j}, \varphi_{j}\right\}_{j \in J}$ be the Whitney partition of unity on $D$ (see [12, Ch.VI, $\left.\S 1\right]$ ). Recall that $J$ is some countable set (for "nonoverlapping" the notations we assume that $J \cap$ $\{0,1, \ldots N\}=\emptyset), B_{j}=B\left(\mathbf{b}_{j}, \delta_{j}\right), \mathbf{b}_{j} \in D$ and there is $A_{1} \geq 3 N$ (depending only on $N$ ) such that

$$
\begin{equation*}
\frac{1}{A_{1}} \rho\left(\mathbf{b}_{j}\right) \leq \delta_{j} \leq \frac{1}{6} \rho\left(\mathbf{b}_{j}\right) ; \tag{3.11}
\end{equation*}
$$

furthermore, for each $\mathbf{z} \in D$ the number $\#(\mathbf{z}, J)$ of balls $B_{j}, j \in J$, that intersect $B(\mathbf{z}, \rho(\mathbf{z}) / 2)$ satisfies

$$
\begin{equation*}
\#(\mathbf{z}, J) \leq A_{1} ; \tag{3.12}
\end{equation*}
$$

and $\varphi_{j} \in C_{0}^{\infty}\left(B_{j}\right), \varphi_{j} \geq 0$, have the properties

$$
\begin{equation*}
\left\|\Delta \varphi_{j}\right\| \leq \frac{A_{1}}{\delta_{j}^{2}}, \quad \sum_{j \in J} \varphi_{j}(\mathrm{x}) \equiv 1 \quad(\mathrm{x} \in D) \tag{3.13}
\end{equation*}
$$

Put $\mu_{j}=\mu \varphi_{j}$ and define $\hat{\mu}(\mathbf{x})=\int_{D} G(\mathbf{x}, \mathbf{y}) d \mu_{\mathbf{y}}, \hat{\mu_{j}}(\mathbf{x})=\int G(\mathbf{x}, \mathbf{y}) d \mu_{j \mathbf{y}}$.
Since $f=u_{i}+\hat{\mu}$ in $D$ (see [13, Theorem 1.24]), we have $\hat{\mu} \in C^{1}(D)$. We claim that also $\hat{\mu}_{j} \in C^{1}(\bar{D})$ and

$$
\begin{equation*}
\left\|\hat{\mu}_{j}\right\|_{1, \bar{D}} \leq A M \tag{3.14}
\end{equation*}
$$

In fact, let $f_{j}=\Phi * \mu_{j}$. By (3.13) and [8, Lemma 4.2], we have $f_{j} \in C^{1}\left(\mathbb{R}^{N}\right)$ and

$$
\begin{equation*}
\left\|\nabla f_{j}\right\| \leq A M \tag{3.15}
\end{equation*}
$$

and by (3.9) and (3.4), for $\mathbf{x} \in D \backslash B\left(\mathbf{b}_{j},(3 / 2) \delta_{j}\right)$,

$$
\left|\nabla \hat{\mu_{j}}(\mathbf{x})\right| \leq\left|\int \nabla_{\mathbf{x}} G(\mathbf{x}, \mathbf{y}) d \mu_{j \mathbf{y}}\right| \leq \int_{B_{j}} \frac{A_{1} \rho(\mathbf{y}) \varphi_{j}(\mathbf{y}) d \mu_{\mathbf{y}}}{|\mathbf{x}-\mathbf{y}|^{N}} \leq A_{2} \frac{\delta_{j}^{N}}{\left(\delta_{j} / 2\right)^{N}} \leq A M .
$$

Since $\hat{\mu}_{j}-f_{j}$ is harmonic in $D$, it remains to apply the maximum principle in $B\left(\mathbf{b}_{j}, \frac{3}{2} \delta_{j}\right)$ for $\frac{\partial}{\partial x_{n}}\left(\hat{\mu}_{j}-f_{j}\right), n \in\{1, \ldots, N\}$, and recall that $\left.\hat{\mu}_{j}\right|_{\partial D}=0$. The claim (3.14) is proved.

Notice also, that the property (3.15) of $f_{j}$ allows to reduce the proof Theorem 3 to the case when

$$
\begin{equation*}
\text { Supp } \mu \subset\left\{\mathbf{x} \in D \mid \rho(\mathbf{x})<r_{2}\right\}, \tag{3.16}
\end{equation*}
$$

where some fixed $r_{2}=r_{2}(\varepsilon(\cdot)) \in\left(0, r_{0} / 32\right)$ will be chosen later (see (3.22)). In fact, let $J_{0}=\left\{j \in J \mid \rho\left(\mathbf{b}_{j}\right) \geq r_{2} / 2\right\}$. Then $F_{0}=\sum_{j \in J_{0}} f_{j}$ is subharmonic in $\mathbb{R}^{N},\left\|F_{0}\right\|_{1} \leq A M$, and it remains to extend $\left.\left(f-F_{0}\right)\right|_{\bar{D}}$ instead of $f$.

So, in the sequel we shall always require (3.16). The reflection of $\mu$ over $S$ (having (3.16) and $\left.\rho\left(\mathbf{b}_{j}\right)<r_{2} / 2\right)$ consist of the following. For each $j \in J\left(J_{0}=\emptyset\right)$, let $\mathbf{a}_{j} \in S$ be (some) point closest to $\mathbf{b}_{j},\left|\mathbf{a}_{j}-\mathbf{b}_{j}\right|=\rho\left(\mathbf{b}_{j}\right)$. Let $P_{j}=P_{\mathbf{a}_{j}}$ be hyperplane tangent to $S$ at $\mathbf{a}_{j}$. Define $\mu_{j}^{*}$ as a measure, "symmetric" to $\mu_{j}$ with respect to $P_{j}$ (that is, $\mu_{j}(E)=\mu_{j}^{*}\left(E_{j}^{*}\right)$ for each Borel set $E$ and the set $E_{j}^{*}$ symmetric to $E$ with respect to $P_{j}$ ). The measure

$$
\mu^{*}=\sum_{j \in J} \mu_{j}^{*}
$$

is the desired reflection of $\mu$ "over" $S$.
For checking (3.10) it remains to prove the following result (the case $\mathbf{a}=0$ in (3.10)) and use the maximum principle. Notice also, that $\operatorname{Supp} \mu^{*} \subset B(\mathbf{0}, 2 d)$ and we can use Theorem W2 in order to estimate $G_{o}(\mathbf{x}, \mathbf{y})$ for $|\mathbf{y}|<2 d$.
Theorem 3.5. $\operatorname{Let} \hat{\mu}^{*}(\mathbf{x})=\int G_{o}(\mathbf{x}, \mathbf{y}) d \mu_{\mathbf{y}}^{*}, \hat{\mu}_{j}^{*}(\mathbf{x})=\int G_{o}(\mathbf{x}, \mathbf{y}) d \mu_{j \mathbf{y}}^{*}, \mathbf{x} \in \overline{D_{o}}$. Let $\mathbf{z} \in D$ be such that $\mathbf{z}=\left(0, \ldots, z_{N}\right), 0<z_{N}<r_{0} / 4, \mathbf{a}=\mathbf{0}$ is closest (one of) to $\mathbf{z}$ on $S$. Then

$$
\begin{equation*}
\left|\nabla \hat{\mu}(\mathbf{z})-\overline{\nabla \hat{\mu}^{*}(\overline{\mathbf{z}})}\right| \leq A M \tag{3.17}
\end{equation*}
$$

where the "overline" (for vectors) means symmetry with respect to the hyperplane $P_{\mathbf{0}}=$ $\left\{\mathbf{x} \in \mathbb{R}^{N} \mid x_{N}=0\right\}$ tangent to $S$ at $\mathbf{a}=\mathbf{0}$.

Proof. Let $Q_{\mathbf{0}}$ and $\varphi_{\varepsilon}(\cdot)$ be as in the proof of Theorem 3.1. We can find $\tilde{D}$ (by analogy with $D^{\prime}$ ) with the properties: $\tilde{D} \cap\left\{\mathbf{y}=\left(\mathbf{y}^{\prime}, y_{N}\right) \in \mathbb{R}^{N}| | \mathbf{y}^{\prime} \mid<r_{0} / 16\right\}=$

$$
=\left\{\mathbf{y} \in \mathbb{R}^{N}| | \mathbf{y}^{\prime} \mid<r_{0} / 16,8 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)<y_{N}<r_{0} / 2-8 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right\},
$$

$y_{N}>8 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)$ for all $\mathbf{y} \in \tilde{D}, \tilde{D}$ is convex radially symmetric with respect to $\mathbf{y}^{\prime}$ domain having Dini-function bounded by $A \varepsilon(\cdot)$, and $\tilde{D} \subset\left\{\mathbf{y} \in \mathbb{R}^{N}| | \mathbf{y}^{\prime} \mid<r_{0} / 8\right\}$. Let $\tilde{D}_{o}$ be symmetric to $\tilde{D}$ with respect to $P_{\mathbf{0}}$ (recall, that $\varepsilon(r) \leq 1 / 8$ for $0<r \leq r_{0}$ ).
Lemma 3.6. Let $J_{1}=\left\{j \in J \mid \mathbf{b}_{j} \in D \backslash \tilde{D}\right\}$, then

$$
\begin{equation*}
\Sigma_{1}=\sum_{j \in J_{1}}\left(\left|\nabla \hat{\mu_{j}}(z)\right|+\left|\nabla \hat{\mu}_{j}^{*}(z)\right|\right) \leq A M . \tag{3.18}
\end{equation*}
$$

Proof. Let first $j \in J_{1}$ be such that $\left|\mathbf{b}_{j}^{\prime}\right| \leq r_{0} / 16$. Then (since $\rho\left(\mathbf{b}_{j}\right)<r_{2} / 2<r_{0} / 2$ )we have $\left|b_{j N}\right| \leq 8 \varphi_{\varepsilon}\left(\left|\mathbf{b}_{j}^{\prime}\right|\right) \leq 8\left|\mathbf{b}_{j}^{\prime}\right| \varepsilon\left(\left|\mathbf{b}_{j}^{\prime}\right|\right) \leq\left|\mathbf{b}_{j}^{\prime}\right|$, so that $\rho\left(\mathbf{b}_{j}\right) \leq\left|\mathbf{b}_{j}\right| \leq \sqrt{2}\left|\mathbf{b}_{j}^{\prime}\right|$. Therefore, for all $\mathbf{y} \in B_{j}$ we have, by (3.11),

$$
\left|\mathbf{y}-\mathbf{b}_{j}\right| \leq \frac{1}{6} \rho\left(\mathbf{b}_{j}\right) \leq \frac{1}{4}\left|\mathbf{b}_{j}^{\prime}\right|
$$

and so $\left|\mathbf{b}_{j}^{\prime}\right| \leq 4\left|\mathbf{y}^{\prime}\right| / 3$, which gives also $|\mathbf{y}| \leq 2\left|\mathbf{y}^{\prime}\right|$ and

$$
\rho(\mathbf{y}) \leq \frac{7}{6} \rho\left(\mathbf{b}_{j}\right) \leq 20 \varphi_{\varepsilon}\left(\left|\mathbf{b}_{j}^{\prime}\right|\right) \leq A\left|\mathbf{y}^{\prime}\right| \varepsilon\left(\mathbf{y}^{\prime}\right) .
$$

And for these $j$ we have by (3.4):

$$
\left|\nabla \hat{\mu}_{j}(\mathbf{z})\right| \leq \int\left|\nabla_{\mathbf{x}} G(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}} \left\lvert\, d \mu_{j \mathbf{y}} \leq \int \frac{A_{1} \rho(\mathbf{y})}{|\mathbf{z}-\mathbf{y}|^{N}} d \mu_{j \mathbf{y}} \leq \int \frac{A_{2}\left|\mathbf{y}^{\prime}\right| \varepsilon\left(\left|\mathbf{y}^{\prime}\right|\right) d \mu_{j \mathbf{y}}}{|\mathbf{y}|^{N}}\right.
$$

The same estimate holds also for $\left|\nabla \mu_{j}^{*}(\mathbf{z})\right|$ (see Lemma 3.8 bellow). Since the part of the sum in (3.18) for $j$ with the property $\left|\mathbf{b}_{j}^{\prime}\right|>r_{0} / 16$ can be estimated easily, we obtain

$$
\begin{equation*}
\Sigma_{1} \leq A\left(M+\int_{|\mathbf{y}| \leq r_{0}} \frac{\varepsilon(|\mathbf{y}|) d \mu_{\mathbf{y}}}{|\mathbf{y}|^{N-1}}\right) \tag{3.19}
\end{equation*}
$$

and (3.18) immediately follows from the following elementary lemma.
Lemma 3.7. Let $h(t)$ be a nondecreasing function on $[0,+\infty)$ with the property $0 \leq$ $h(t) \leq t^{N-1}, t \geq 0$. Then, for any $r>0$,

$$
\int_{0}^{r} \frac{\varepsilon(t)}{t^{N-1}} d h(t) \leq(N-1) \int_{0}^{r} \frac{\varepsilon(t)}{t} d t
$$

Proof. For $\delta \in(0, r)$ put $h_{\delta}(t)=\varepsilon(\delta) / \delta^{N-1}$ in $(0, \delta)$ and $h_{\delta}(t)=\varepsilon(t) / t^{N-1}$ in $[\delta, a]$. Since $h_{\delta}$ is positive and decreasing, the result follows directly applying Abel summation for the Riemann sums of the integral $\int_{0}^{r} h_{\delta}(t) d h(t)$, and then letting $\delta \rightarrow 0$.

To finish the proof of (3.18), we calculate the integral in (3.19) using spherical coordinates in $\mathbb{R}_{\mathbf{y}}^{N}$. Concretely, let $h(r)=\mu(B(\mathbf{0}, r))$. By (3.9) (since $\mu=0$ outside $D$ ) we have $h(r) \leq A_{1} M r^{N-1}$, and so

$$
\begin{equation*}
\int_{|\mathbf{y}| \leq r_{0}} \frac{\varepsilon(|\mathbf{y}|) d \mu_{\mathbf{y}}}{|\mathbf{y}|^{N-1}} \leq A_{2} M \int_{0}^{r_{0}} \frac{\varepsilon(r) d r}{r} \leq A M . \tag{3.20}
\end{equation*}
$$

Lemma 3.6 is proved.
Lemma 3.8. Let $j \in J$ be such that $\left|\mathbf{b}_{j}\right| \leq r_{0} / 2$. Then for each $\mathbf{y} \in B_{j}$ we have

$$
\begin{equation*}
\left|\overline{\mathbf{y}}-\mathbf{y}_{j}^{*}\right| \leq A_{*}|\mathbf{y}| \varepsilon(|\mathbf{y}|), \tag{3.21}
\end{equation*}
$$

where $\mathbf{y}_{j}^{*}$ is symmetric to $\mathbf{y}$ with respect to $P_{j}$ and $A_{*} \leq 108$.
Proof. Since $\left|\mathbf{b}_{j}\right| \leq r_{0} / 2$, by definition of $\mathbf{a}_{j}$ we have $\left|\mathbf{a}_{j}\right| \leq 2\left|\mathbf{b}_{j}\right| \leq r_{0}$, so that $\mathbf{a}_{j} \in S \cap Q_{\mathbf{0}}$ and $a_{j N}=\varphi\left(\mathbf{a}_{j}^{\prime}\right)$ (recall that $|\varphi(r)| \leq 2 r \varepsilon(r) \leq r / 4$ for $\left.r \leq r_{0}\right)$. Since $|\mathbf{y}| \in\left(\frac{5}{6}\left|\mathbf{b}_{j}\right|, \frac{7}{6}\left|\mathbf{b}_{j}\right|\right)$ for $\mathbf{y} \in B_{j}$, we have $\left|\mathbf{a}_{j}\right| \leq 3|\mathbf{y}|$ for these $\mathbf{y}$. Elementary calculations show that

$$
\overline{\mathbf{y}}-\mathbf{y}_{j}^{*}=\mathbf{y}-2\left(\mathbf{y}, \mathbf{n}_{\mathbf{0}}^{i}\right) \mathbf{n}_{\mathbf{0}}^{i}-\left(\mathbf{y}-2\left(\mathbf{y}-\mathbf{a}_{j}, \mathbf{n}_{j}^{i}\right) \mathbf{n}_{j}^{i}\right)=2\left(\mathbf{y}-\mathbf{a}_{j}, \mathbf{n}_{j}^{i}\right) \mathbf{n}_{j}^{i}-2\left(\mathbf{y}, \mathbf{n}_{\mathbf{0}}^{i}\right) \mathbf{n}_{\mathbf{0}}^{i},
$$

where $\mathbf{n}_{\mathbf{0}}^{i}$ and $\mathbf{n}_{j}^{i}$ are the inner unit normals to $S$ at $\mathbf{x}=\mathbf{0}$ and $\mathbf{x}=\mathbf{a}_{j}$ respectively. Then

$$
\left|\overline{\mathbf{y}}-\mathbf{y}_{j}^{*}\right| \leq 2\left|a_{j N}\right|+6\left|\mathbf{y}-\mathbf{a}_{j}\right|\left|\mathbf{n}_{j}^{i}-\mathbf{n}_{\mathbf{0}}^{i}\right| .
$$

Since $\left|\mathbf{n}_{j}^{i}-\mathbf{n}_{\mathbf{0}}^{i}\right| \leq \varepsilon\left(\left|\mathbf{a}_{j}\right|\right)$, we easily obtain (3.21) using the "doubling" property of $\varepsilon(\cdot)$.

The final restriction on $r_{2}$ is (see (3.21))

$$
\begin{equation*}
A_{*} \varepsilon\left(r_{2}\right)<\frac{1}{20} . \tag{3.22}
\end{equation*}
$$

In particular, in Lemma 3.8 we also have

$$
\begin{equation*}
\left|\overline{\mathbf{y}}-\mathbf{y}_{j}^{*}\right| \leq \frac{1}{4}|\mathbf{y}| \tag{3.23}
\end{equation*}
$$

whenever $|\mathbf{y}|<5 r_{2}$.
Notice, that for $|\mathbf{z}|=z_{N} \geq 2 r_{2}$ the proof of (3.17) is easy, because, by (3.4) and (3.9), we even have

$$
\begin{equation*}
|\nabla \hat{\mu}(\mathbf{z})| \leq \int\left|\nabla_{\mathbf{x}} G(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}} \left\lvert\, d \mu_{\mathbf{y}} \leq A_{1} \int \frac{\rho(\mathbf{y}) d \mu_{\mathbf{y}}}{|\mathbf{z}-\mathbf{y}|^{N}} \leq A_{2} r_{2} \frac{\sigma(\partial D) M}{r_{2}^{N}} \leq A M\right. \tag{3.24}
\end{equation*}
$$

and the same estimate holds also for $\left|\nabla \hat{\mu^{*}}(\overline{\mathbf{z}})\right|$. So, from now on, we suppose that $|\mathbf{z}| \leq$ $2 r_{2} \leq r_{0} / 16$. Consider the set $\Omega_{\mathbf{z}}=\left\{\mathbf{y}| | \mathbf{y}|/ 2>|\mathbf{y}-\mathbf{z}|\}\right.$ which is in fact $\Omega_{\mathbf{z}}=\{\mathbf{y}| | \mathbf{y}-$ $\left.\left.\frac{4}{3} \mathbf{z}\left|<\frac{2}{3}\right| \mathbf{z} \right\rvert\,\right\}$.

The set $J_{2}=\left\{j \in J \backslash J_{1} \mid B_{j} \cap \Omega_{\mathbf{z}} \neq \emptyset\right\}$ is "small" (the number of its elements can be estimated with the help of (3.12)). By (3.14) (the analogous estimate holds also for $\hat{\mu}_{j}^{*}$ ) we have

$$
\Sigma_{2}=\sum_{j \in J_{2}}\left(\left|\nabla \hat{\mu_{j}}(\mathbf{z})\right|+\left|\nabla \hat{\mu}_{j}^{*}(\overline{\mathbf{z}})\right|\right) \leq A M
$$

Let now, $J_{3}=\left\{j \in J \backslash\left(J_{1} \cup J_{2}\right)| | \mathbf{b}_{\mathbf{j}} \mid>4 r_{2}\right\}$. Then, like in (3.24),

$$
\Sigma_{3}=\sum_{j \in J_{3}}\left(\left|\nabla \hat{\mu}_{j}(\mathbf{z})\right|+\left|\nabla \hat{\mu_{j}^{*}}(\overline{\mathbf{z}})\right|\right) \leq A M
$$

Put $J_{4}=J \backslash\left(J_{1} \cup J_{2} \cup J_{3}\right)$ and let $\nu_{j}, j \in J_{4}$, be the measure "symmetric" to $\mu_{j}$ with respect to $P_{\mathbf{0}}\left(\mu_{j}(E)=\nu_{j}\left(E_{\mathbf{0}}^{*}\right)\right.$ for any Borel set $\left.E\right)$.

We claim that

$$
\begin{equation*}
\sum_{j \in J_{4}} \mid \nabla \hat{\nu_{j}}(\overline{\mathbf{z}})-\nabla \hat{\mu}_{j}^{*}(\overline{\mathbf{z}}) \leq A M, \tag{3.25}
\end{equation*}
$$

where $\hat{\nu_{j}}(\mathbf{x})=\int G_{o}(\mathbf{x}, \mathbf{y}) d \nu_{j \mathbf{y}}$. In fact, for $j \in J_{4}$ one has

$$
\nabla \hat{\nu_{j}}(\overline{\mathbf{z}})-\nabla \hat{\mu}_{j}^{*}(\overline{\mathbf{z}})=\left.\int \nabla_{\mathbf{x}} G_{o}(\mathbf{x}, \overline{\mathbf{y}})\right|_{\mathbf{x}=\overline{\mathbf{z}}} d \mu_{j \mathbf{y}}-\left.\int \nabla_{\mathbf{x}} G_{o}\left(\mathbf{x}, \mathbf{y}_{j}^{*}\right)\right|_{\mathbf{x}=\overline{\mathbf{z}}} d \mu_{j \mathbf{y}}
$$

$\left|\mathbf{b}_{j}\right| \leq 4 r_{2}$, and (by (3.11)) $|\mathbf{y}| \leq 5 r_{2} \leq r_{0} / 6$ whenever $\mathbf{y} \in B_{j}$, so that (3.23) holds for all $\mathbf{y} \in \Omega_{4}=\cup_{j \in J_{4}} B_{j}$. Since also (as $j \notin J_{2}$ ) $\Omega_{4} \cap \Omega_{\mathbf{z}}=\emptyset$, we have finally for all $\mathbf{y} \in \Omega_{4}$ :

$$
\begin{equation*}
|\mathbf{y}| \leq 5 r_{2},|\mathbf{y}-\mathbf{z}| \geq \frac{1}{2}|\mathbf{y}|,|\mathbf{y}-\mathbf{z}| \geq|\mathbf{z}| / 3,\left|\overline{\mathbf{y}}-\mathbf{y}_{j}^{*}\right| \leq \frac{1}{4}|\mathbf{y}| . \tag{3.26}
\end{equation*}
$$

Therefore, for $\mathbf{y} \in \Omega_{4}$ we can write:

$$
\left|\nabla_{\mathbf{x}} G_{o}(\mathbf{x}, \overline{\mathbf{y}})\right|_{\mathbf{x}=\overline{\mathbf{z}}}-\left.\nabla_{\mathbf{x}} G_{o}\left(\mathbf{x}, \mathbf{y}_{j}^{*}\right)\right|_{\mathbf{x}=\overline{\mathbf{z}}}\left|\leq\left\|\left.\nabla_{\mathbf{x}} \nabla_{\tilde{\mathbf{y}}} G_{o}(\mathbf{x}, \tilde{\mathbf{y}})\right|_{\mathbf{x}=\overline{\mathbf{z}}}\right\|_{\tilde{\mathbf{y}} \in\left[\overline{\mathbf{y}}, \mathbf{y}_{j}^{*}\right]}\right| \overline{\mathbf{y}}-\mathbf{y}_{j}^{*} \mid
$$

and so, by (3.5), (3.21) and (3.26),

$$
\sum_{j \in J_{4}}\left|\nabla \hat{\nu_{j}}(\overline{\mathbf{z}})-\nabla \hat{\mu}_{j}^{*}(\overline{\mathbf{z}})\right| \leq \int_{B\left(\mathbf{0}, 5 r_{2}\right)} \frac{A_{1}}{|\mathbf{z}-\mathbf{y}|^{N}} A_{*}|\mathbf{y}| \varepsilon(|\mathbf{y}|) d \mu_{\mathbf{y}} \leq A \int_{B\left(\mathbf{0}, r_{0}\right)} \frac{\varepsilon(|\mathbf{y}|) d \mu_{\mathbf{y}}}{|\mathbf{y}|^{N-1}},
$$

which gives (3.25) by (3.20).
Finally, it remains to prove that

$$
\Sigma_{4}=\sum_{j \in J_{4}}\left|\nabla \hat{\mu}_{j}(\mathbf{z})-\overline{\nabla \hat{\nu_{j}}(\overline{\mathbf{z}})}\right| \leq A M .
$$

Using (3.12) we then have

$$
\begin{equation*}
\Sigma_{4} \leq A \int_{\Omega_{4}}\left|\nabla_{\mathbf{x}}\left(G(\mathbf{x}, \mathbf{y})-G_{o}^{*}(\mathbf{x}, \mathbf{y})\right)\right|_{\mathbf{x}=\mathbf{z}} \mid d \mu_{\mathbf{y}} \tag{3.27}
\end{equation*}
$$

where $G_{o}^{*}(\mathbf{x}, \mathbf{y})=G_{o}(\overline{\mathbf{x}}, \overline{\mathbf{y}})\left(\right.$ defined on $\left.\left(\left(D_{o}\right)_{\mathbf{0}}^{*}\right)^{2}\right)$.
Recall, that for $j \in J_{4}$ (as $j \notin J_{1}$ ) we have $\mathbf{b}_{j} \in \tilde{D}$, but it is not necessary that also $\mathbf{y} \in \tilde{D}$. The part of the integral in (3.27) with $\mathbf{y} \in \Omega_{4} \backslash \tilde{D}$ looks like

$$
\int_{\Omega_{4} \backslash \tilde{D}}\left|\nabla_{\mathbf{x}}\left(G(\mathbf{x}, \mathbf{y})-G_{o}^{*}(\mathbf{x}, \mathbf{y})\right)\right|_{\mathbf{x}=\mathbf{z}} \mid d \mu_{\mathbf{y}} \leq A M
$$

it can be estimated the same way as in (3.19)(Lemma 3.6) or as in (3.24).
So, it remains to estimate the integral

$$
I_{1}=\int_{\Omega_{4} \cap \tilde{D}}\left|\nabla_{\mathbf{x}}\left(G(\mathbf{x}, \mathbf{y})-G_{o}^{*}(\mathbf{x}, \mathbf{y})\right)\right|_{\mathbf{x}=\mathbf{z}} \mid d \mu_{\mathbf{y}}
$$

Notice, that for $\mathbf{y} \in \tilde{D}$ we have $y_{N}>8 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)$, so that (since $\left|\varphi\left(\mathbf{y}^{\prime}\right)\right| \leq 4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)$ and $\left.\varphi_{\varepsilon}^{\prime}(r)=\varepsilon(r) \leq 1 / 8\right)$

$$
|\mathbf{y}| \geq \rho(\mathbf{y}) \geq \frac{2}{\sqrt{5}}\left(y_{N}-4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right) \geq y_{N} / 3, \quad \rho(\mathbf{y}) \leq 2 y_{N}
$$

and the same holds for the distance from $\mathbf{y}$ to $(S)_{\mathbf{0}}^{*}$.
Also in $\Omega_{4}$ we have $|\mathbf{y}-\mathbf{z}| \geq|\mathbf{z}| / 3$ (as $\Omega_{4} \cap \Omega_{\mathbf{z}}=\emptyset$, see above). In order to estimate $I_{1}$ consider several steps.
$1^{0}$. Set $\Omega_{4}^{\prime}=\Omega_{4} \cap \tilde{D} \cap\{|\mathbf{y}|<3|\mathbf{z}|\}$. Then, by (3.4) and (3.9),

$$
\int_{\Omega_{4}^{\prime}}\left|\nabla_{\mathbf{x}} G(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}} \left\lvert\, d \mu_{\mathbf{y}} \leq A_{1} \int_{\Omega_{4}^{\prime}} \frac{\rho(\mathbf{y})}{|\mathbf{z}-\mathbf{y}|^{N}} d \mu_{\mathbf{y}} \leq A_{2} \int_{\Omega_{4}^{\prime}} \frac{|\mathbf{y}| d \mu(\mathbf{y})}{|\mathbf{z}|^{N}} \leq A M\right.,
$$

and the same way one estimates $\int_{\Omega_{4}^{\prime}}\left|\nabla_{\mathbf{x}} G_{o}^{*}(\mathbf{x}, \mathbf{y})\right|_{\mathbf{x}=\mathbf{z}} \mid d \mu_{\mathbf{y}}$.
$2^{0}$. Set $\Omega_{5}=\Omega_{4} \cap \tilde{D} \cap\{|\mathbf{y}| \geq 3|\mathbf{z}|\}$. Take $\Psi_{\mathbf{y}}(\mathbf{x})=G(\mathbf{x}, \mathbf{y})-G_{o}^{*}(\mathbf{x}, \mathbf{y})$ as a function of $\mathbf{x}$, $\mathbf{x} \in \overline{D^{\prime}}\left(\mathbf{y} \in \Omega_{5}\right.$ is fixed). We need to estimate $\left|\nabla \Psi_{\mathbf{y}}(\mathbf{z})\right|$. Since $\Psi_{\mathbf{y}} \in H\left(D^{\prime}\right) \cap C^{1}(\bar{D})$ we can use (3.6) for $\Psi_{\mathbf{y}}$ in $D^{\prime}$. To do this let us estimate $\Psi_{\mathbf{y}}(\mathbf{x})$ on $\partial D^{\prime}$. If $\mathbf{x}=\left(\mathbf{x}^{\prime}, 4 \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right)\right) \in \partial D^{\prime}$ is such that $\left|\mathbf{x}^{\prime}\right|<r_{0} / 3$, we have:

$$
\left|G(\mathbf{x}, \mathbf{y})-G\left(\mathbf{x}_{\varphi}, \mathbf{y}\right)\right| \leq\|\nabla G(\cdot, \mathbf{y})\|_{\left[\mathbf{x}_{\varphi}, \mathbf{x}\right]}\left|4 \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right)-\varphi\left(\mathbf{x}^{\prime}\right)\right|,
$$

where $\mathbf{x}_{\varphi}=\left(\mathbf{x}^{\prime}, \varphi\left(\mathbf{x}^{\prime}\right)\right) \in S$ (so that $G\left(\mathbf{x}_{\varphi}, \mathbf{y}\right)=0$ ). We need the following lemma.

Lemma 3.9 (Elementary). In the notations just above we have

$$
\min _{\tilde{\mathbf{x}} \in\left[\mathbf{x}_{\varphi}, \mathbf{x}\right]}|\mathbf{y}-\tilde{\mathbf{x}}| \geq A_{1}\left|\mathbf{y}-\mathbf{x}^{\prime}\right|
$$

where $A_{1} \in(0,+\infty)$ is absolute constant, and we identify $\left(\mathbf{x}^{\prime}, 0\right)$ and $\mathbf{x}^{\prime}$.
Proof. Consider a trapezium with the vertices at $\mathbf{y}=\left(\mathbf{y}^{\prime}, y_{N}\right), \mathbf{y}^{\prime}, \mathbf{x}^{\prime}, \mathbf{x}$ and let $\mathbf{y}_{\varepsilon}=$ $\left(\mathbf{y}^{\prime}, 4 \varphi_{\varepsilon}\left(\left|\mathbf{y}^{\prime}\right|\right)\right)$. Then $y_{N}>2 y_{\varepsilon N}$ and it is not hard to see that for each $\tilde{\mathbf{x}} \in\left[\mathbf{x}_{\varphi}, \mathbf{x}\right]$ the angle between the vectors $\mathbf{y}-\mathbf{y}_{\varepsilon}$ and $\tilde{\mathbf{x}}-\mathbf{y}_{\varepsilon}$ is greater than $\pi / 2-\arctan (1 / 2)$ (since $\left.4 \varphi_{\varepsilon}^{\prime}(r)=4 \varepsilon(r) \leq 1 / 2, r \leq r_{0}\right)$. Simple trigonometric calculations end the proof.

Now, by (3.4), we have

$$
\begin{aligned}
\mid G(\mathbf{x}, \mathbf{y})- & G\left(\mathbf{x}_{\varphi}, \mathbf{y}\right)\left|\leq\|\nabla G(\cdot, \mathbf{y})\|_{\left[\mathbf{x}_{\varphi}, \mathbf{x}\right]}\right| 2 \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right)-\varphi\left(\mathbf{x}^{\prime}\right) \mid \leq \\
& \leq A_{1} \frac{\rho(\mathbf{y})}{\left|\mathbf{y}-\mathbf{x}^{\prime}\right|^{N}} 8 \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right) \leq A \frac{y_{N} \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right)}{\left|\mathbf{y}-\mathbf{x}^{\prime}\right|^{N}},
\end{aligned}
$$

Proceeding the same way with $G_{o}^{*}$ (and $\mathbf{x}_{-\varphi}=\left(\mathbf{x}^{\prime},-\varphi\left(\mathbf{x}^{\prime}\right)\right)$ instead of $\left.\mathbf{x}_{\varphi}\right)$ we finally get

$$
\left|\Psi_{\mathbf{y}}(\mathbf{x})\right| \leq A \frac{y_{N} \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right)}{\left|\mathbf{y}-\mathbf{x}^{\prime}\right|^{N}}
$$

for $\mathbf{x} \in S^{\prime}=\left\{\mathbf{x}^{\prime}, 4 \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right),\left|\mathbf{x}^{\prime}\right|<r_{0} / 3\right\}$. Therefore, by (3.6) and (3.5), applied in $D^{\prime}$,

$$
\begin{gathered}
\left|\nabla \Psi_{\mathbf{y}}(\mathbf{z})\right|=\left|\int_{\partial D^{\prime}}\left(\nabla_{\mathbf{z}} \frac{\partial}{\partial \mathbf{n}_{\mathbf{x}}} G^{\prime}(\mathbf{z}, \mathbf{x})\right) \Psi_{\mathbf{y}}(\mathbf{x}) d \sigma_{\mathbf{x}}\right| \leq\left|\int_{S^{\prime}}\right|+\left|\int_{\partial D^{\prime} \backslash S^{\prime}}\right| \leq \\
\leq \int_{S^{\prime}} \frac{A_{1} y_{N} \varphi_{\varepsilon}\left(\left|\mathbf{x}^{\prime}\right|\right) d \sigma_{\mathbf{x}}}{|\mathbf{z}-\mathbf{x}|^{N}\left|\mathbf{y}-\mathbf{x}^{\prime}\right|^{N}}+A_{2}
\end{gathered}
$$

The penultimate integral is clearly less then $A_{2}$, because $\left|\mathbf{y}^{\prime}\right| \leq r_{0} / 8(\mathbf{y} \in \tilde{D})$ and $|\mathbf{x}| \geq$ $r_{0} / 3$ (as $\mathbf{x} \notin S^{\prime}$ ).

Again, using Lemma 3.9 for $\mathbf{z}$ in place of $\mathbf{y}$, we see that in order to estimate $\left|\nabla \Psi_{\mathbf{y}}(\mathbf{z})\right|$ it remains to estimate the integral

$$
I_{2}=\int_{\left|\mathbf{x}^{\prime}\right| \leq r_{0} / 3} K_{\mathbf{z y}}\left(\mathbf{x}^{\prime}\right) d \mathbf{x}^{\prime}, \quad \mathbf{y} \in \Omega_{5}
$$

where we set

$$
K_{\mathrm{zy}}\left(\mathbf{x}^{\prime}\right)=\frac{y_{N}\left|\mathbf{x}^{\prime}\right| \varepsilon\left(\left|\mathbf{x}^{\prime}\right|\right)}{\left|\mathbf{z}-\mathbf{x}^{\prime}\right|^{N}\left|\mathbf{y}-\mathbf{x}^{\prime}\right|^{N}} .
$$

Consider 3 cases.
Case 1. Here $\left|\mathbf{x}^{\prime}\right| \leq\left|\mathbf{y}^{\prime}\right| / 2$, and we apply spherical coordinates in $\mathbb{R}_{\mathbf{x}^{\prime}}^{N}$ :

$$
\int_{\left|\mathbf{x}^{\prime}\right| \leq|\mathbf{y}| / 2} K_{\mathbf{z y}}\left(\mathbf{x}^{\prime}\right) d \mathbf{x}^{\prime} \leq \frac{A_{1}}{|\mathbf{y}|^{N-1}} \int_{0}^{|\mathbf{y}| / 2} \frac{r \varepsilon(r) r^{N-2} d r}{r^{N}} \leq \frac{A_{1}}{|\mathbf{y}|^{N-1}} \lambda_{1}(|\mathbf{y}|)
$$

where $\lambda_{1}(t)=\int_{0}^{t} \frac{\varepsilon(\tau)}{\tau} d \tau$.

Lemma 3.10. In the previous notations, for each $r \in(0,1]$,

$$
\int_{0}^{r} \frac{\lambda_{1}(t)}{t} d t \leq \int_{0}^{r} \frac{\varepsilon(t)}{t} \log \frac{1}{t} d t
$$

Proof. Apply the following corollary of Fubini's theorem: $\int_{0}^{r} d t \int_{0}^{t} f d \tau=\int_{0}^{r} d \tau \int_{\tau}^{r} f d t$.
Case 2. Here $\mathbf{x}^{\prime} \in K^{\prime}$, where $K^{\prime}=\left\{\mathbf{x}^{\prime} \in \mathbb{R}^{N-1}| | \mathbf{y}\left|/ 2 \leq\left|\mathbf{x}^{\prime}\right| \leq 2\right| \mathbf{y} \mid\right\}$. Then

$$
\int_{K^{\prime}} K_{\mathrm{zy}}\left(\mathbf{x}^{\prime}\right) d \mathbf{x}^{\prime} \leq A_{1} \frac{\varepsilon(|\mathbf{y}|)}{|\mathbf{y}|^{N-1}} \int_{K^{\prime}} \frac{y_{N} d \mathbf{x}^{\prime}}{\left|\mathbf{x}^{\prime}-\mathbf{y}\right|^{N}} \leq A_{2} \frac{\varepsilon(|\mathbf{y}|)}{|\mathbf{y}|^{N-1}} \int_{0}^{3|\mathbf{y}|} \frac{y_{N} r^{N-2} d r}{\left(r^{2}+y_{N}^{2}\right)^{N / 2}} \leq A \frac{\varepsilon(|\mathbf{y}|)}{|\mathbf{y}|^{N-1}}
$$

The penultimate integral is estimated in spherical coordinates of $\mathbb{R}_{\mathbf{x}^{\prime}-\mathbf{y}^{\prime}}^{N-1}$.
Case 3. Here $\left|\mathbf{x}^{\prime}\right|>2\left|\mathbf{y}^{\prime}\right|$, so that

$$
\int_{\left|\mathbf{x}^{\prime}\right|>2|\mathbf{y}|} K_{\mathbf{z y}}\left(\mathbf{x}^{\prime}\right) d \mathbf{x}^{\prime} \leq A|\mathbf{y}| \int_{2|\mathbf{y}|}^{r_{0} / 3} \frac{r \varepsilon(r) r^{N-2} d r}{r^{2 N}} \leq A \int_{|\mathbf{y}|}^{r_{0}} \frac{\varepsilon(r) d r}{r^{N}}=\frac{A}{|\mathbf{y}|^{N-1}} \lambda_{2}(|\mathbf{y}|)
$$

where

$$
\lambda_{2}(t)=t^{N-1} \int_{t}^{r_{0}} \frac{\varepsilon(\tau)}{\tau^{N}} d \tau
$$

Lemma 3.11. In the previous notation,

$$
\int_{0}^{r_{0}} \frac{\lambda_{2}(t)}{t} d t=\frac{1}{N-1} \int_{0}^{r_{0}} \frac{\varepsilon(t)}{t} d t
$$

Proof. As in the proof of Lemma 3.10 (take $r=r_{0}$ ).
Therefore, we obtain:

$$
\left|\nabla \Psi_{\mathbf{y}}(\mathbf{z})\right| \leq A \frac{\varepsilon(|\mathbf{y}|)+\lambda_{1}(|\mathbf{y}|)+\lambda_{2}(|\mathbf{y}|)}{|\mathbf{y}|^{N-1}}=A \frac{\lambda(|\mathbf{y}|)}{|\mathbf{y}|^{N-1}}
$$

To finally estimate $I_{1}$, it remains to check the following inequality:

$$
\int_{\Omega_{5}}\left|\nabla \Psi_{\mathbf{y}}(\mathbf{z})\right| d \mu_{\mathbf{y}} \leq A_{1} \int_{|\mathbf{y}| \leq r_{0}} \frac{\lambda(|\mathbf{y}|)}{|\mathbf{y}|^{N-1}} d \mu_{\mathbf{y}} \leq A_{2} M \int_{0}^{r_{0}} \frac{\lambda(r)}{r} d r \leq A M
$$

which follows from (3.9) and Lemmas 3.7, 3.10 and 3.11 (since, clearly, $\lambda(\rho)$, in place of $\varepsilon(\rho)$, also satisfies the conditions of Lemma 3.7).

Theorem 3.5 is proved.
We terminate the proof of Theorem 3 following that one of Theorem 2. Let $f \in$ $C^{1}(\bar{D}) \cap S H(D)$ and $m=\|f\|_{1, \bar{D}}$. For $p \in\{1,2, \ldots\}$ we can find $g_{p} \in C^{1}\left(\overline{D_{p}}\right) \cap S H\left(D_{p}\right)$ harmonic on $D_{p} \backslash \bar{D}\left(D_{p}=D_{\delta_{p}}, \delta_{p} \in(0,1)\right.$ is small enough), $\left\|g_{p}\right\|_{1, \overline{D_{p}}} \leq A m / 2^{p}$ and $f=\left.\sum_{p=1}^{+\infty} g_{p}\right|_{\bar{D}}$. The proof of this fact is almost the same as (for balls) in [2, Lemma 5.2] (plus iterations). It remains to appropriately extend each $g_{p}$ (from $\bar{D}$ ). Put $\Omega_{p}=\mathbb{R}^{N} \backslash \bar{D}_{p}$ and $S_{p}=\partial D_{p}$. By Theorem 3.5 we find the subharmonic reflection $h_{p}$ of $g_{p}$ over $S_{p}$ (that is, $h_{p} \in C^{1}\left(\overline{\Omega_{p}}\right) \cap S H\left(\Omega_{p}\right), h_{p}=g_{p}$ on $S_{p}$ and $\left.\left\|h_{p}\right\|_{1, \overline{\Omega_{p}}} \leq A\left\|g_{p}\right\|_{1, \overline{D_{p}}}\right)$. It follows from the proof of Theorem 3.5 that $h_{p} \in H\left(D_{\delta^{\prime}} \backslash \bar{D}_{\delta_{p}}\right)$ for some $\delta^{\prime}>\delta_{p}$. It suffices (taking (2.2) into account) to add appropriate $t w_{p}$ and make a regularization without changing $g_{p}$ on $\bar{D}$ (which can be done because $g_{p}$ is harmonic in $D_{p} \backslash \bar{D}$ ).

## 4 Examples and background.

Example 4.1. Let $D$ be any bounded convex domain in $\mathbb{R}^{N}(N \geq 2)$ such that $S=\partial D$ contains the set $B_{\delta}^{\prime}=\left\{\mathbf{x}=\left(\mathbf{x}^{\prime}, x_{N}\right) \in \mathbb{R}^{N}\left|x_{N}=0,\left|\mathbf{x}^{\prime}\right|<\delta\right\}\right.$ for some $\delta>0$. Then there exists $\psi \in C^{1}(\bar{D}) \cap S H(D)$ such that the solution $\Psi$ of the Dirichlet problem in $D$ with the boundary data $\left.\psi\right|_{S}$ is not in $C^{1}(\bar{D})$.

Proof. We can suppose that $\delta \in(0,1 / 4)$ and

$$
D \subset \Omega=\left\{\mathbf{x} \in \mathbb{R}^{N}\left|x_{N}>0,\left|\mathbf{x}^{\prime}\right|<1 / 2\right\} .\right.
$$

Fix $p \in(0,1)$ and define

$$
\psi(\mathbf{x})=\psi\left(\left|\mathbf{x}^{\prime}\right|\right)=\frac{\left|\mathbf{x}^{\prime}\right|}{\left.|\log | \mathbf{x}^{\prime}\right|^{p}}, \quad\left|\mathbf{x}^{\prime}\right| \in(0,1)
$$

$\psi(\mathbf{0})=0$. It can be easily checked that $\psi \in C^{1}(\bar{\Omega}) \cap S H(\Omega)$. Let $\psi_{0}\left(\mathbf{x}^{\prime}\right)=\psi\left(\mathbf{x}^{\prime}\right)$ for $\left|\mathrm{x}^{\prime}\right|<1 / 2$ and $\psi_{0}\left(\mathrm{x}^{\prime}\right)=\psi(1 / 2),\left|\mathrm{x}^{\prime}\right| \geq 1 / 2$, and let $\Psi_{0}$ be the Dirichlet solution in $\mathbb{R}_{+}^{N}=\left\{\mathbf{x} \in \mathbb{R}^{N} \mid x_{N}>0\right\}$ with the boundary data $\psi_{0}$. By the Poisson formula in $\mathbb{R}_{+}^{N}$ one has for $x_{N} \in(0,1 / 2)$ :

$$
\begin{gathered}
\Psi_{0}\left(\mathbf{0}^{\prime}, x_{N}\right)=\frac{2}{\sigma_{N}} \int_{\mathbb{R}_{\mathbf{y}^{\prime}}^{N-1}} \frac{x_{N} \psi_{0}\left(\mathbf{y}^{\prime}\right)}{\left|\left(\mathbf{y}^{\prime}, 0\right)-\left(\mathbf{0}^{\prime}, x_{N}\right)\right|^{N}} d \mathbf{y}^{\prime} \geq \frac{2 \sigma_{N-1}}{\sigma_{N}} \int_{0}^{1 / 2} \frac{x_{N} r r^{N-2} d r}{\left(r^{2}+x_{N}^{2}\right)^{N / 2}\left(\log \frac{1}{r}\right)^{p}} \geq \\
\geq A(N) x_{N} \int_{x_{N}}^{1 / 2} \frac{d r}{r\left(\log \frac{1}{r}\right)^{p}}=\frac{A(N) x_{N}}{1-p}\left(\left(\log \frac{1}{x_{N}}\right)^{1-p}-(\log 2)^{1-p}\right),
\end{gathered}
$$

so that, clearly, $\partial \Psi_{0} /\left.\partial x_{N}\right|_{\mathbf{x}=\mathbf{0}}=+\infty$. On the other hand, we can find $\delta_{0} \in(0, \delta)$ and $\lambda_{0}>0$ such that $B_{0}^{+}=\left\{\mathbf{x} \in \mathbb{R}^{N}\left|x_{N}>0,\left|\mathbf{x}^{\prime}\right|<\delta_{0}\right\} \subset D\right.$ and $\lambda_{0} \Psi_{0} \leq \Psi$ on $\partial B_{0}^{+}$.

Therefore,

$$
\Psi\left(\mathbf{0}^{\prime}, x_{N}\right) \geq \lambda_{0} A(N) x_{n}\left(\log \frac{1}{x_{N}}\right)^{1-p}, \quad x_{N} \in\left(0, \delta_{0}\right)
$$

which ends the proof and shows (letting $p \rightarrow 0+$ ) that the estimate (3.3) is "almost" precise. It is also easily seen that the function $-\left.\psi\right|_{\partial D} \in C^{1}(S)$ can not be extended to $\bar{D}$ as a function of the class $C^{1}(\bar{D}) \cap S H(D)$.

In the next example we construct a $C^{1}$-smooth convex "almost" ( $\mathrm{L}-\mathrm{D}$ ) domain $D$ in $\mathbb{R}^{2}$ for which the $C^{1}$-harmonic reflection property (see Theorem 1) does not hold. This example shows that the (sufficient) (L-D) condition on $D$ in Theorem 1 is "almost" sharp. An analogous example in $\mathbb{R}^{N}, N \geq 3$ can be then easily obtained.

Example 4.2. Set $B_{+}=\{\zeta \in \mathbb{C}| | \zeta \mid<1 / e, \operatorname{Re} \zeta>0\}$ and $\Sigma^{\prime}=\{\zeta \in \mathbb{C}|\operatorname{Re} \zeta=0,|\zeta|<$ $1 / e\} \subset \partial B_{+}$. The function $k(\zeta)=-\zeta / \log (\zeta)$ maps conformally $B_{+}$onto some domain $\Omega_{+}$and $k$ is homeomorphism $\overline{B_{+}}$onto $\overline{\Omega_{+}}$(we set $k(0)=0$ ). Here $\log (\zeta)$ means the main holomorphic branch of logarithm in $\mathbb{C} \backslash(-\infty, 0], \log (1)=0$. One checks the conformality of $k$ on $B_{+}$applying the classical inverse principal of boundaries correspondence. It can
be easily shown that $S^{\prime}=k\left(\Sigma^{\prime}\right)$ is $C^{1}$-smooth curve, convex "to the right". Moreover, on $S^{\prime}$ we have (for some $A \in(0,+\infty)$ )

$$
0 \leq-x_{1} \leq A \frac{x_{2}}{|\log | x_{2}| |}, \quad\left|x_{2}\right| \leq\left(1+\frac{\pi^{2}}{4}\right)^{-1} e^{-1}
$$

Notice that the curve $-x_{2}=\left|x_{2}\right| / /\left.\log \left|x_{2}\right|\right|^{p}$ with $p>1$ is Lyapunov-Dini curve.
Then there exists bounded convex $C^{1}$-smooth domain $D \subset\left\{z=x_{1}+i x_{2} \in \mathbb{C} \mid x_{1}<0\right\}$ such that $S^{\prime} \subset S=\partial D$ and $S \backslash\{0\}$ is $C^{\infty}$-smooth. Consider $u_{i}(\mathbf{x})=-x_{1} \in H(D) \cap$ $C^{\infty}(\bar{D})$. We claim that the corresponding $u_{o}$ (see the notations in Theorem 1) satisfies

$$
\begin{equation*}
\left.\frac{\partial u_{o}}{\partial x_{1}}\right|_{\mathbf{0}}=\frac{\partial u_{o}}{\partial \mathbf{n}_{\mathbf{0}}^{o}}=+\infty . \tag{4.1}
\end{equation*}
$$

In fact, take $h(\mathbf{x})=\operatorname{Re}\left(k^{-1}(z)\right)$ in $\overline{\Omega_{+}}\left(\mathbf{x}=\left(x_{1}, x_{2}\right)\right)$. One can find $\lambda \in(0,+\infty)$ such that $\lambda u_{o} \geq h$ on $\partial \Omega_{+}$, and so in $\Omega$ by the maximum principle. So that (4.1) follows from the equality $\partial h /\left.\partial x_{1}\right|_{\mathbf{0}}=+\infty$. This example also shows that the Green function of the ("almost" (L-D)) domain $\Omega_{+}^{*}$ (obtained from $\Omega_{+}$by "smoothing" $\partial \Omega_{+}$near it's "angle"-points) does not satisfy [7, Theorem 2.3] (see also Theorem 4.5 below).

Example 4.3. For $p \in(0,+\infty)$ define a $C^{1}$-function

$$
f_{p}(t)=-\frac{|t|}{\left.|\log | t\right|^{p}}, \quad t \in[-1 / 2,1 / 2], \quad t \neq 0
$$

and $f_{p}(0)=0$.
(1) For $p \in(0,1]$ there do not exist $\delta>0$ and a function $F$ continuous and subharmonic on $B_{\delta}=\left\{\mathbf{x} \in \mathbb{R}^{2}| | \mathbf{x} \mid<\delta\right\}$, such that $F\left(x_{1}, 0\right)=f\left(x_{1}\right)$ for $\left|x_{1}\right|<\delta$.
(2) For each $p \in(1,+\infty)$ one can find $F \in C_{\text {loc }}^{1}\left(\mathbb{R}^{2}\right) \cap S H\left(\mathbb{R}^{2}\right)$ with $F\left(x_{1}, 0\right)=f\left(x_{1}\right)$ for all $x_{1} \in[-1 / 2,1 / 2]$ and $\|\nabla F\|<+\infty$.

Proof. Set $g_{p}(t)=f_{p}(t)$ for $|t| \leq 1 / 2$ and let $g_{p}(t)$ be some negative bounded even $C^{2}$-function for $|t|>0$. Let $F_{p}^{+}$(respectively, $F_{p}^{-}$) be the Dirichlet solution in $\mathbb{R}_{+}^{2}$ (respectively, in $\left.\mathbb{R}_{-}^{N}=\left\{\mathbf{x} \in \mathbb{R}^{2} \mid x_{2}<0\right\}\right)$ with the boundary data $g_{p}$. By the Poisson formula we have for all $\alpha \in(0, \pi)$ and $r \in(0,1 / 2$ :

$$
\begin{gathered}
F_{p}^{+}(r \cos \alpha, r \sin \alpha)=F_{p}^{-}(r \cos \alpha,-r \sin \alpha)=\frac{1}{\pi} \int_{-\infty}^{+\infty} \frac{r \sin \alpha g_{p}(t) d t}{(t-r \cos \alpha)^{2}+r^{2} \sin ^{2} \alpha} \geq \\
\quad \geq \frac{r \sin \alpha}{2 \pi} \int_{0}^{+\infty} \frac{g_{p}(t) d t}{t^{2}+r^{2}} \leq-\frac{r \sin \alpha}{4 \pi} \int_{r}^{1 / 2} \frac{d t}{t|\log | t \|^{p}}=-r \sin \alpha h_{p}(r),
\end{gathered}
$$

where $h_{p}(r) \rightarrow+\infty$ as $r \rightarrow 0+$ wherever $p \in(0,1]$.
Fix $p \in(0,1]$ and suppose, by contradiction, that such $F$ in (1) exists.
Put $M=\sup _{|\mathbf{x}|=\delta / 2}\left(|F(\mathbf{x})|+\left|F_{p}(\mathbf{x})\right|\right)<+\infty$ and let $u_{+}$(respectively, $u_{-}$) be the solution of the Dirichlet problem in $B_{\delta / 2}^{+}=B_{\delta / 2} \cap \mathbb{R}_{+}^{2}$ (respectively, $B_{\delta / 2}^{-}=B_{\delta / 2} \cap \mathbb{R}_{-}^{2}$ ) with the boundary data 0 on $\partial B_{\delta / 2}^{ \pm} \cap\left\{x_{2}=0\right\}$ and $M$ on the rest of the boundary. By Theorem W1(2) there is $A \in(0,+\infty)$ such that

$$
\left|u_{+}\left(x_{1}, x_{2}\right)\right|+\left|u_{-}\left(x_{1}, x_{2}\right)\right| \leq A x_{2}
$$

for each $\mathbf{x}=\left(x_{1}, x_{2}\right)$ with $|\mathbf{x}| \leq \delta / 4$ and $x_{2} \geq 0$.
Therefore, for $\alpha \in(0, \pi)$ and $r \in(0, \delta / 4)$ one has (as $F \leq F_{p}^{ \pm}+u_{ \pm}$in $B_{\delta / 2}^{ \pm}$)

$$
F(r \cos \alpha, \pm r \sin \alpha) \leq-r \sin \alpha\left(h_{p}(r)-A\right), \quad F(\mathbf{0})=0,
$$

which clearly, contradicts to the subharmoniticity of $F(\mathbf{x})$ at $\mathbf{x}=\mathbf{0}$ by the mean value property.

Let now $p>1$. It is not difficult to check (see also Theorem 4.9 below) that $F_{p}^{-} \in$ $C^{1}\left(\mathbb{R}_{-}^{2}\right)$. It suffices to apply Theorem 2.

Recall, that in [3, Theorem 3.1] it was proved that the (L-D) condition is in some sense necessary in Theorem 3. For instance, in the scale of functions $\varepsilon_{p}(\cdot)$ (see Remark 3.2 above) we have the lack of the extension (in the sense of Theorem 3) for $p \in(0,1]$. For $p \geq 1$ domains with the Dini-function $\varepsilon_{p}(\cdot)$ are (L-D) domains. The case $p>2$ is covered by Theorem 3. The case $p \in(1,2]$ is still unconsidered.

We also do not know if the (L-D) condition in Theorem 2 is precise.
In the rest of the paper we discuss the proofs of Theorems W1 and W2 following basically the ideas of the original proofs in [7]. In particular, we check that all the appearing constants depend only on $N, d=\operatorname{diam} D$ and $\varepsilon(\cdot)$. The last is important for the proofs of our main results. Also, for the interested reader (especially beginner) it would be very useful to check all the details of the proofs, which look rather useful in applications. First we present the detailed proof of the main working result of $[7]-[7$, Theorem 2.2].

Theorem 4.4. Let $\varepsilon_{1}(t)$ be a Dini-type function with $\varepsilon_{1}(1) \leq 1 / 2$. Define $\varphi_{1}(r)=$ $\int_{0}^{r} \varepsilon_{1}(t) d t$, so that $t \varepsilon_{1}(t) / 2 \leq \varphi_{1}(t) \leq t \varepsilon_{1}(t)$ and $-\varphi_{1}$ is concave. Put

$$
T_{1}=\left\{\mathbf{x} \in \mathbb{R}^{N}| | \mathbf{x}^{\prime} \mid \leq 1,-\varphi_{1}\left(\left|\mathbf{x}^{\prime}\right|\right) \leq x_{N} \leq 1\right\}
$$

$\Sigma_{1}=\left\{\mathbf{x} \in \partial T_{1} \mid x_{N}=-\varphi_{1}\left(\left|\mathbf{x}^{\prime}\right|\right)\right\}$. Let $u_{1} \in H\left(T_{1}^{\circ}\right)$ have the boundary values $\left.u_{1}\right|_{\Sigma_{1}}=0$, $\left.u_{1}\right|_{\partial T_{1} \backslash \Sigma_{1}}=1$ (with $\left\|u_{1}\right\|_{T_{1}} \leq 1$ ). Then there exists a constant $A_{1}=A_{1}(N, \varepsilon(\cdot)) \in(0,+\infty)$ such that

$$
\left|u_{1}\left(\mathbf{0}^{\prime}, x_{N}\right)\right| \leq A_{1} x_{N}, \quad x_{N} \in(0,1] .
$$

Proof. Set $T_{2}=\left\{\mathbf{z} / 2 \mid \mathbf{z} \in T_{1}\right\}, T_{2}\left(\mathbf{x}^{\prime}\right)=\left\{\mathbf{z}+\left(\mathbf{x}^{\prime},-2 \varphi_{1}\left(\mathbf{x}^{\prime}\right)\right) \mid \mathbf{z} \in T_{2}\right\}, \Sigma_{2}\left(\mathbf{x}^{\prime}\right)=\{\mathbf{z} / 2+$ $\left.\left(\mathbf{x}^{\prime},-2 \varphi_{1}\left(\mathbf{x}^{\prime}\right)\right) \mid \mathbf{z} \in \Sigma_{1}\right\} \subset \partial T_{2}\left(\mathbf{x}^{\prime}\right)$. We claim that for $\left|\mathbf{x}^{\prime}\right|<1 / 2$ one has $\Sigma_{2}\left(\mathbf{x}^{\prime}\right) \cap \Sigma_{1}=\emptyset$ (that is, $\Sigma_{2}$ is "below" $\Sigma_{1}$ ). In fact, it is enough to check that

$$
\chi_{t}(s)=2 \varphi_{1}(t)+\frac{1}{2} \varphi_{1}(2 s)-\varphi_{1}(t+s) \geq 0
$$

for all $t \geq 0$ and $s \geq 0$. It is easily seen that the function $\chi_{t}(s)$ ( $t$ fixed) has it's minimum at $s=t$, so that it is enough to see that $\lambda(t)=\chi_{t}(t) \geq 0, t \geq 0$. But $\lambda(0)=0$ and $\lambda^{\prime}(t)=2 \varepsilon_{1}(t)-\varepsilon_{1}(2 t) \geq 0$, which ends the proof of the claim.

Let $u_{2}^{\prime} \in H\left(\left(T_{2}\left(\mathbf{x}^{\prime}\right)\right)^{\circ}\right)$ have the boundary values $u_{2}^{\prime}=0$ on $\Sigma_{2}\left(\mathbf{x}^{\prime}\right)$ and $u_{2}^{\prime}=1$ on $\partial T_{2}\left(\mathbf{x}^{\prime}\right) \backslash \Sigma_{2}\left(\mathbf{x}^{\prime}\right)$ (with $\left\|u_{2}^{\prime}\right\|_{T_{2}\left(\mathbf{x}^{\prime}\right)} \leq 1$ ). Since, clearly, $\left(\mathbf{x}^{\prime}, 0\right) \in T_{2}\left(\mathbf{x}^{\prime}\right)$, by the maximum principle for $u_{1}$ and $u_{2}^{\prime}$ in $T_{1} \cap T_{2}\left(\mathrm{x}^{\prime}\right)$ we have

$$
u_{1}\left(\mathbf{x}^{\prime}, 0\right) \leq u_{2}^{\prime}\left(\mathbf{x}^{\prime}, 0\right)=u_{1}\left(\mathbf{0}^{\prime}, 4 \varphi_{1}\left(\left|\mathbf{x}^{\prime}\right|\right)\right)
$$

for all $\mathrm{x}^{\prime}$ with $\left|\mathrm{x}^{\prime}\right| \leq 1 / 2$.

Let $u_{\psi}$ be the solution of the Dirichlet problem in $\mathbb{R}_{+}^{N}$ with the boundary data $\psi\left(\mathbf{x}^{\prime}\right)=$ $u_{1}\left(\mathbf{0}, 4 \varphi_{1}\left(\left|\mathbf{x}^{\prime}\right|\right)\right),\left|\mathbf{x}^{\prime}\right| \leq 1 / 2, \psi\left(\mathbf{x}^{\prime}\right)=1$ for $\left|\mathbf{x}^{\prime}\right| \geq 1 / 2$. By the Poisson formula,

$$
u_{\psi}\left(\mathbf{x}^{\prime}, x_{N}\right)=\frac{2}{\sigma_{N}} \int_{\mathbb{R}^{N-1}} \frac{x_{N}}{\left(\left(\mathbf{y}^{\prime}-\mathbf{x}^{\prime}\right)^{2}+x_{N}^{2}\right)^{N / 2}} \psi\left(\mathbf{y}^{\prime}\right) d \mathbf{y}^{\prime}
$$

It is clear that $u_{\psi}\left(\mathbf{x}^{\prime}, x_{N}\right) \geq 1 / 2$ for $\left|\mathbf{x}^{\prime}\right| \geq 1 / 2$. For $\left|\mathbf{x}^{\prime}\right| \leq 1 / 2$ we have

$$
u_{\psi}\left(\mathbf{x}^{\prime}, 1\right) \geq \frac{2}{\sigma_{N}} \int_{1}^{+\infty} \frac{\sigma_{N-1} r^{N-2} d r}{\left(r^{2}+1\right)^{N / 2}} \geq \frac{1}{\sigma_{N}} \int_{0}^{+\infty} \frac{\sigma_{N-1} r^{N-2} d r}{\left(r^{2}+1\right)^{N / 2}}=\frac{1}{2}
$$

(one estimates the corresponding integral $\int_{0}^{1}$ changing variables $t=1 / r$ ). We then have $u\left(\mathbf{x}^{\prime}, x_{N}\right) \leq 2 u_{\psi}\left(\mathbf{x}^{\prime}, x_{N}\right)$ and so, for $x_{N} \in(0,1)$,

$$
u\left(\mathbf{0}^{\prime}, x_{N}\right) \leq \frac{4 \sigma_{N-1}}{\sigma_{N}}\left(\int_{0}^{\delta} \frac{x_{N} u\left(\mathbf{0}^{\prime}, 4 \varphi_{1}(r)\right) r^{N-2} d r}{\left(r^{2}+x_{N}^{2}\right)^{N / 2}}+\int_{\delta}^{+\infty} \frac{x_{N} r^{N-2} d r}{\left(r^{2}+x_{N}^{2}\right)^{N / 2}}\right)
$$

where $\delta \in(0,1 / 2]$ will be choosen later.
Suppose that

$$
A_{1}=\sup _{x_{N} \in(0,1]} \frac{u_{1}\left(\mathbf{0}^{\prime}, x_{N}\right)}{x_{N}}<+\infty
$$

and let $t \in(0,1]$ be such that $u_{1}\left(\mathbf{0}^{\prime}, t\right) / t \geq A_{1} / 2$.
Then we have for $A_{2}=32 \sigma_{N-1} / \sigma_{N}$ :

$$
A_{1} t \leq 2 u_{1}\left(\mathbf{0}^{\prime}, t\right) \leq A_{2}\left(\int_{0}^{\delta} \frac{t A_{1} \varphi_{1}(r) r^{N-2} d r}{\left(r^{2}+t^{2}\right)^{N / 2}}+\frac{1}{4} \int_{\delta}^{+\infty} \frac{t r^{N-2} d r}{\left(r^{2}+t^{2}\right)^{N / 2}}\right) .
$$

Therefore,

$$
A_{1} \leq A_{2}\left(A_{1} \int_{0}^{\delta} \frac{\varepsilon_{1}(r)}{r} d r+\frac{1}{4 \delta}\right)
$$

Take the maximal $\delta=\delta_{1} \in(0,1 / 2]$ such that

$$
A_{2} \int_{0}^{\delta_{1}} \frac{\varepsilon_{1}(r)}{r} d r \leq 1 / 2
$$

and we find $A_{1} \leq A_{2} /\left(2 \delta_{1}\right)$.
To finish the proof of Theorem 4.4 we need to reduce the general situation to the case when we know that $A_{1}<+\infty$. To this end, for each fixed $\theta \in(0,1 / 2)$ define $\varepsilon_{\theta}(t)=\varepsilon_{1}(\theta) t / \theta_{1}$ for $t \in\left(0, \theta_{1}\right), \varepsilon_{\theta}(t)=\varepsilon_{1}(\theta)$ for $t \in\left[\theta_{1}, \theta\right]$, and $\varepsilon_{\theta}(t)=\varepsilon_{1}(t)$ for $t \geq \theta$, where $\theta_{1} \in(0, \theta)$ is chosen such that

$$
\int_{0}^{\theta} \varepsilon_{\theta}(t) d t=\int_{0}^{\theta} \varepsilon_{1}(t) d t
$$

which gives $\theta_{1}=2\left(\theta-\int_{0}^{\theta} \frac{\varepsilon_{1}(t)}{\varepsilon_{1}(\theta)} d t\right)$. Recall that $\varepsilon_{1}(k t) \geq k \varepsilon_{1}(t)$ for $k \in(0,1]$.
The main reason to consider the function $\varepsilon_{\theta}(\cdot)$ is the following. Each $\varepsilon_{\theta}(\cdot)$ is a Dinitype function such that $\varphi_{\theta}(t)=\int_{0}^{t} \varepsilon_{\theta}(\tau) d \tau$ is equal to $\varphi_{1}(t)$ for $t \geq \theta$ and $\varphi_{\theta}(t) \leq \varphi_{1}(t)$ for $t \in[0, \theta]$. Moreover:

$$
\int_{0}^{r} \frac{\varepsilon_{\theta}(t)}{t} d t \leq \int_{0}^{r} \frac{\varepsilon_{1}(t)}{t} d t, \quad \forall r>0
$$

In fact, integration by parts gives:

$$
\begin{gather*}
\int_{0}^{r} \frac{\varepsilon_{\theta}(t)}{t} d t=\int_{0}^{r} \frac{d \varphi_{\theta}(t)}{t}=\frac{\varphi_{\theta}(r)}{r}+\int_{0}^{r} \frac{\varphi_{\theta}(t)}{t^{2}} d t \leq \\
\leq \frac{\varphi_{1}(r)}{r}+\int_{0}^{r} \frac{\varphi_{1}(t)}{t^{2}} d t=\int_{0}^{r} \frac{\varepsilon_{1}(t)}{t} d t . \tag{4.2}
\end{gather*}
$$

Let $T_{\theta}, u_{\theta}, A_{\theta}$ be defined for $\varepsilon_{\theta}(\cdot)$ as $T_{1}, u_{1}, A_{1}$ for $\varepsilon_{1}(\cdot)$ in Theorem 4.4 above. We claim that $A_{\theta}$ are finite for each $\theta \in(0,1 / 2)$. In fact, given $\theta$ one can find $\delta_{\theta} \in(0,1 / 4)$ such that $B\left(\left(\mathbf{0}^{\prime},-\delta_{\theta}\right), \delta_{\theta}\right) \subset \mathbb{R}^{N} \backslash T_{\theta}$ and so the claim follows from the maximum principle (in the domain $\left.T_{\theta} \subset T_{1}\right)$ for $u_{\theta}$ and $v_{\theta}(\mathbf{x})=l_{\theta}\left(\delta_{\theta}^{2-N}-\left|\mathbf{x}+\left(\mathbf{0}^{\prime}, \delta_{\theta}\right)\right|^{2-N}\right)$ with an appropriate $l_{\theta}>0$. It remains to note that $u_{\theta} \rightarrow u_{1}$ as $\theta \rightarrow 0$, and apply (4.2) to see that $A_{\theta}$ depend only on $\varepsilon_{1}(\cdot)$.

Theorem 4.5. Let $D$ be a (L-D) domain in $\mathbb{R}^{N}$ with the Dini function $\varepsilon(\cdot)$ and $d=$ diam $D$. Let $G(\mathbf{x}, \mathbf{y})$ be the Green function for $D$. Then there is $A=A(N, d, \varepsilon) \in(0,+\infty)$ such that for each $\mathbf{x}$ and $\mathbf{y}$ in $D$ one has

$$
\begin{align*}
& \text { (1) }|G(\mathbf{x}, \mathbf{y})| \leq A \rho(\mathbf{x})|\mathbf{x}-\mathbf{y}|^{1-N}, \text { here } N \geq 3 \text {; }  \tag{1}\\
& \text { (2) }\left|\partial G(\mathbf{x}, \mathbf{y}) / \partial x_{n}\right| \leq A|\mathbf{x}-\mathbf{y}|^{1-N}, \\
& \text { (3) }\left|\partial G(\mathbf{x}, \mathbf{y}) / \partial y_{n}\right| \leq A \rho(\mathbf{x})|\mathbf{x}-\mathbf{y}|^{-N}, \\
& \text { (4) }\left|\partial^{2} G(\mathbf{x}, \mathbf{y}) /\left(\partial x_{m} \partial y_{n}\right)\right| \leq A|\mathbf{x}-\mathbf{y}|^{-N}
\end{align*}
$$

for all $m$ and $n$ in $\{1, \ldots, N\}$.
The same estimates hold for the Green functions of (and in) bounded components of $D_{o}$. For the unbounded component $D_{*}$ of $D_{o}$, the estimates (1)-(4) hold also for the Green function $G_{*}$ of $D_{*}$ (in place of $G$ ) for all $\mathbf{y} \in B(\mathbf{0}, 2 d) \cap D_{*}$ (presumably, $\mathbf{0} \in \bar{D}$ ) and all $\mathrm{x} \in D_{*}$.

Proof. We consider only the case $N \geq 3$. The proof of (2)-(4) for $N=2$ can be obtained using conformal mappings [14, Theorem 3.5].
(1). Let, as before, $r_{0} \in(0,1]$ be the maximal number with the property $\varepsilon\left(r_{0}\right) \leq 1 / 8$. Fix $\mathbf{y} \in D$. We can suppose that $\mathbf{x}=\left(\mathbf{0}^{\prime}, x_{N}\right) \in D, x_{N}>0$, is such that $\rho(\mathbf{x})=|\mathbf{x}|$, and $\mathbf{0} \in \partial D$ is the closest to $\mathbf{x}$ on $\partial D$. It is trivial that

$$
0 \leq-G(\mathbf{x}, \mathbf{y}) \leq \frac{A_{2}}{|\mathbf{x}-\mathbf{y}|^{N-2}}
$$

where $A_{2}=A_{2}(N)$. If $\rho(\mathbf{x}) \geq r_{0}$ then

$$
|G(\mathbf{x}, \mathbf{y})| \leq \frac{A_{2}|\mathbf{x}-\mathbf{y}|}{|\mathbf{x}-\mathbf{y}|^{N-1}} \leq \frac{A_{2} d}{|\mathbf{x}-\mathbf{y}|^{N-1}} \leq \frac{A_{3} \rho(\mathbf{x})}{|\mathbf{x}-\mathbf{y}|^{N-1}}
$$

where $A_{3}=A_{2} d / r_{0}$. Also, if $|\mathbf{x}-\mathbf{y}| \leq 8 \rho(\mathbf{x})$ then

$$
|G(\mathbf{x}, \mathbf{y})| \leq \frac{A_{2}|\mathbf{x}-\mathbf{y}|}{|\mathbf{x}-\mathbf{y}|^{N-1}} \leq \frac{8 A_{2} \rho(\mathbf{x})}{|\mathbf{x}-\mathbf{y}|^{N-1}}
$$

It remains to consider the case $\left\{\rho(\mathbf{x})<r_{0}, \rho(\mathbf{x})<|\mathbf{x}-\mathbf{y}| / 8\right\}$. Put $r=\min \left\{r_{0},|\mathbf{x}-\mathbf{y}| / 8\right\}$, so that $0 \leq x_{N}=\rho(\mathbf{x})<r \leq r_{0}$. Let, as before, $Q_{r}=\left\{\mathbf{z} \in \mathbb{R}^{N},\left|\mathbf{z}^{\prime}\right| \leq r,\left|z_{N}\right| \leq r\right\}$. We
claim that $\operatorname{dist}\left(\mathbf{y}, \partial Q_{r}\right) \geq|\mathbf{x}-\mathbf{y}| / 2$, which follows easily considering the cases $r<r_{0}$ and $r=r_{0}$. Therefore,

$$
|G(\mathbf{x}, \mathbf{y})| \leq \frac{2^{N} A_{2}}{|\mathbf{x}-\mathbf{y}|^{N-2}}=M_{G}, \quad \forall \mathbf{x} \in \partial\left(Q_{r} \cap D\right)
$$

Define $\varepsilon_{1}(t)=4 \varepsilon(r t)$, so that $\varepsilon_{1}(t)$ satisfies the conditions of Theorem 4.4, and, since $\varepsilon_{1}(t) \leq 4 \varepsilon(t)$, we have

$$
\begin{equation*}
\int_{0}^{t} \frac{\varepsilon_{1}(\tau)}{\tau} d \tau \leq 4 \int_{0}^{t} \frac{\varepsilon(\tau)}{\tau} d \tau, \quad t>0 \tag{4.3}
\end{equation*}
$$

Moreover, if (as before) $\varphi_{\varepsilon}(t)=\int_{0}^{t} \varepsilon(\tau) d \tau$, we have

$$
\varphi_{1}(t)=4 \int_{0}^{t} \varepsilon(r \tau) d \tau=\frac{4}{r} \varphi_{\varepsilon}(r t)
$$

so that the set $T_{1}$ (see the proof of Theorem 4.4) is similar to the set

$$
T_{r}=\left\{\mathbf{z} \in Q_{r} \mid-4 \varphi_{\varepsilon}\left(\left|\mathbf{z}^{\prime}\right|\right) \leq z_{N} \leq r\right\} \supset\left(Q_{r} \cap \bar{D}\right)
$$

with coefficient $1 / r$. By the maximum principle (in $Q_{r} \cap \bar{D}$ ) for the functions $-G(\mathbf{x}, \mathbf{y})$ and $M_{G} u_{1}(\mathrm{x} / r)$, using Theorem 4.4 and (4.3), we get

$$
|G(\mathbf{x}, \mathbf{y})| \leq M_{G} u_{1}\left(\frac{x_{N}}{r}\right) \leq A_{4} \frac{x_{N}}{r} \frac{1}{|\mathbf{x}-\mathbf{y}|^{N-2}}
$$

with $A_{4}=A_{4}(N, \varepsilon(\cdot))$. Finally, if $r=|\mathbf{x}-\mathbf{y}| / 8,\left(r \leq r_{0}\right)$ then

$$
G(\mathbf{x}, \mathbf{y}) \leq \frac{8 A_{4} \rho(\mathbf{x})}{|\mathbf{x}-\mathbf{y}|^{N-1}}
$$

If $|\mathbf{x}-\mathbf{y}| / 8>r_{0}$ (that is, $r=r_{0}$ ), we have

$$
|G(\mathbf{x}, \mathbf{y})| \leq \frac{A_{4} \rho(\mathbf{x})}{r_{0}|\mathbf{x}-\mathbf{y}|^{N-2}} \leq \frac{A_{4} \rho(\mathbf{x}) d}{r_{0}|\mathbf{x}-\mathbf{y}|^{N-1}} \leq \frac{A \rho(\mathbf{x})}{|\mathbf{x}-\mathbf{y}|^{N-1}}
$$

with $A=A_{4} d / r_{0}$. So, finally, $A=A(N, \varepsilon, d)$.
(2). Let $\rho(\mathbf{x}) \leq|\mathbf{x}-\mathbf{y}|$. Take a ball $B_{\mathbf{x}}=B(\mathbf{x}, \rho)$ with $\rho=\rho(\mathbf{x}) / 2$, and represent $G(\mathbf{z}, \mathbf{y})$ at $B_{\mathbf{x}}$ by the Poisson integral:

$$
G(\mathbf{z}, \mathbf{y})=\frac{1}{\sigma_{N}} \int_{\partial B_{\mathbf{x}}} \frac{\rho^{2}-|\mathbf{z}-\mathbf{x}|^{2}}{\rho|\mathbf{z}-\boldsymbol{\zeta}|^{N}} G(\boldsymbol{\zeta}, \mathbf{y}) d \sigma_{\zeta} .
$$

After taking $\partial /\left.\partial z_{n}\right|_{\mathbf{z}=\mathbf{x}}$ under the integral, it suffices to use (1) to have an appropriately estimate of $G(\boldsymbol{\zeta}, \mathbf{y})$ for $\boldsymbol{\zeta} \in \partial B_{\mathbf{x}}$. If $\rho(\mathbf{x})>|\mathbf{x}-\mathbf{y}|$, take $B=B(\mathbf{x},|\mathbf{x}-\mathbf{y}| / 2)$ and do the same in $B$ using the estimate $G(\mathbf{z}, \mathbf{y}) \leq 2^{N} A_{2}|\mathbf{z}-\mathbf{y}|^{2-N}, \mathbf{z} \in \partial B$.
Lemma 4.6. Fixed $\mathbf{y} \in D$, one has $\frac{\partial}{\partial y_{n}} G(\mathbf{x}, \mathbf{y}) \rightarrow 0$ uniformly as $\mathbf{x} \rightarrow \partial D$.

Proof. Fix $r>0$ small enough, so that for $|\mathbf{x}-\mathbf{y}|=r$ we have $G(\mathbf{x}, \mathbf{y}) \geq|\Phi(\mathbf{x}-\mathbf{y}) / 2| \geq$ $A_{5}|\mathbf{x}-\mathbf{y}|^{2-N}, A_{5}=A_{5}(N)$. If $\mathbf{z}$ is a vector with $|\mathbf{z}| \ll r$, we have, by (2), for $|\mathbf{x}-\mathbf{y}|=r$ :

$$
\begin{equation*}
\frac{|G(\mathbf{x}, \mathbf{y}+\mathbf{z})-G(\mathbf{x}, \mathbf{y})|}{|\mathbf{z}|} \leq A|\mathbf{x}-\mathbf{y}|^{1-N} \leq A_{6} r^{-1}|G(\mathbf{x}, \mathbf{y})| \tag{4.4}
\end{equation*}
$$

Since $G(\mathbf{x}, \mathbf{y})=G(\mathbf{x}, \mathbf{y}+\mathbf{z})=0$ for $\mathbf{x} \in \partial D$, the inequality (4.4) holds for all $\mathbf{x} \in$ $D \backslash \overline{B(\mathbf{y}, r)}=D_{r}$ (notice that $|G(\mathbf{x}, \mathbf{y})|=-G(\mathbf{x}, \mathbf{y})$ is harmonic in $\left.D_{r}\right)$. Fixing $\mathbf{x} \in D_{r}$ and letting $|\mathbf{z}| \rightarrow 0$ we get

$$
\left|\nabla_{\mathbf{y}} G(\mathbf{x}, \mathbf{y})\right| \leq A_{6} r^{-1}|G(\mathbf{x}, \mathbf{y})| \leq A_{7} r^{-1} \frac{\rho(\mathbf{x})}{|\mathbf{x}-\mathbf{y}|^{N-1}}
$$

$\mathrm{x} \in D_{r}$, which proves the Lemma.
Finitely, using (2) with $\partial G / \partial y_{n}$ instead of $\partial G / \partial x_{n}$ and applying Lemma 4.6, we obtain (3) the same way as in the proof of (1). Also (4) follows from (3) as (2) follows from (1).

The proof of the last part of Theorem 4.5 (that concerns $G_{*}$ ) goes the same way as before (whenever $|\mathbf{x}|<4 d$ and $|\mathbf{y}|<2 d$ ). In case $|\mathbf{x}| \geq 4 d$ and $|\mathbf{y}|<2 d$ use maximum principle.

Theorem 4.7. In conditions of Theorem 4.5 we have $G(\mathbf{x}, \mathbf{y}) \in C^{1}(\bar{D} \backslash\{\mathbf{y}\})$, $\mathbf{y}$ fixed.
Proof. Fix $\mathbf{y} \in D$. By definition, $G(\mathbf{x}, \mathbf{y})=\Phi(\mathbf{x}-\mathbf{y})-v_{\mathbf{y}}(\mathbf{x})$, where $v(\mathbf{x})=v_{\mathbf{y}}(\mathbf{x}) \in$ $H(D) \cap C(\bar{D})$ and $\left.v\right|_{S}=\left.\Phi(\mathbf{x}-\mathbf{y})\right|_{S} \in C^{2}(S)$. We have to prove that $v \in C^{1}(\bar{D})$. By (2) of Theorem 4.5 and the maximum principle the function $|\nabla v|$ is bounded in $D$. It is enough to prove that there exists a Dini-type function $\varepsilon_{*}$ (independent of $\mathbf{x}$ ) such that for all $n$ and $m$ in $\{1, \ldots, N\}$

$$
\begin{equation*}
\left|\frac{\partial^{2}}{\partial x_{n} \partial x_{m}} v(\mathbf{x})\right| \leq \frac{\varepsilon_{*}(\rho(\mathbf{x}))}{\rho(\mathbf{x})}, \quad \mathbf{x} \in D \tag{4.5}
\end{equation*}
$$

In fact, (4.5) gives that $\nabla v$ is uniformly continuous in $D$ and then, clearly, $v \in C^{1}(\bar{D})$.
To prove (4.5) we can assume that $\mathbf{x}=\left(\mathbf{0}^{\prime}, x_{N}\right), x_{N} \in\left(0, r_{0} / 2\right), \rho(\mathbf{x})=|\mathbf{x}|, \mathbf{0} \in S$ is the closest to $\mathbf{x}$ on $S$. We use the notation from the proof of Theorem $3.1\left(r_{0}, Q_{\mathbf{0}}, D^{\prime}\right.$, $\left.S^{\prime}\right)$ and denote by $G_{+}(\boldsymbol{\zeta}, \boldsymbol{\eta})$ the Green function of $\mathbb{R}_{+}^{N}$.

Let $\left.v\right|_{S}=\left.\psi\right|_{S}$, where $\psi \in C_{0}^{2}\left(\mathbb{R}^{N}\right)$. Take $u(\mathbf{z})=v(\mathbf{z})-\psi(\mathbf{0})-(\nabla \psi(\mathbf{0})$, $\mathbf{z})$, so that $u \in C(\bar{D}) \cap H(D),\|\nabla u\|_{D}<+\infty,\left.u\right|_{S}=\psi_{0}$, where $\psi_{0}(\mathbf{z})=\psi(\mathbf{z})-\psi(\mathbf{0})-(\nabla \psi(\mathbf{0}), \mathbf{z})$ and so

$$
\begin{equation*}
\left|\psi_{0}(\mathbf{z})\right| \leq \omega_{1}(|\mathbf{z}|)|\mathbf{z}| \tag{4.6}
\end{equation*}
$$

with some Dini-type function $\omega_{1}(t)$, independent of $\mathbf{x}$. It suffices to prove (4.5) for $u$ in place of $v$. Using the Gauss-Ostrogradski (or just the second Green's) formula (in $\left.D^{\prime} \subset \mathbb{R}_{+}^{N}\right)$ we get

$$
\begin{gathered}
\int_{\partial D^{\prime}}\left(u(\boldsymbol{\eta}) \frac{\partial G_{+}(\mathbf{z}, \boldsymbol{\eta})}{\partial \mathbf{n}_{\boldsymbol{\eta}}^{o}}-\frac{\partial u(\boldsymbol{\eta})}{\partial \mathbf{n}_{\boldsymbol{\eta}}^{o}} G_{+}(\mathbf{z}, \boldsymbol{\eta})\right) d \sigma_{\boldsymbol{\eta}}= \\
=- \\
-\int_{D^{\prime}}\left(u(\boldsymbol{\zeta}) \Delta_{\zeta} G_{+}(\mathbf{z}, \boldsymbol{\zeta})-\Delta u(\boldsymbol{\zeta}) G_{+}(\mathbf{z}, \boldsymbol{\zeta})\right) d \boldsymbol{\zeta}=-u(\mathbf{z}),
\end{gathered}
$$

where $\mathbf{n}_{\eta}^{o}$ is the inward unit normal to $\partial D^{\prime}$ at $\boldsymbol{\eta}$.
Since $\|\nabla u\|_{D}=M_{u}<+\infty$, we have for $\boldsymbol{\eta}=\left(\boldsymbol{\eta}^{\prime}, 4 \varphi_{\varepsilon}\left(\left|\boldsymbol{\eta}^{\prime}\right|\right)\right),\left|\boldsymbol{\eta}^{\prime}\right|<r_{0} / 3$ (that is, $\left.\boldsymbol{\eta} \in S^{\prime} \subset \partial D^{\prime}\right)$,

$$
\begin{gather*}
|u(\boldsymbol{\eta})| \leq\left|u(\boldsymbol{\eta})-u\left(\boldsymbol{\eta}^{\prime}, \varphi\left(\boldsymbol{\eta}^{\prime}\right)\right)\right|+\mid u\left(\boldsymbol{\eta}^{\prime}, \varphi\left(\boldsymbol{\eta}^{\prime}\right) \mid \leq\right. \\
\leq M_{u} 8 \varphi_{\varepsilon}\left(\left|\boldsymbol{\eta}^{\prime}\right|\right)+\omega_{1}\left(2\left|\boldsymbol{\eta}^{\prime}\right|\right)\left|\boldsymbol{\eta}^{\prime}\right| \leq \omega_{2}\left(\left|\boldsymbol{\eta}^{\prime}\right|\right)\left|\boldsymbol{\eta}^{\prime}\right|, \tag{4.7}
\end{gather*}
$$

where $\omega_{2}(\cdot)$ is a Dini-type function and $\left(\boldsymbol{\eta}^{\prime}, \varphi\left(\boldsymbol{\eta}^{\prime}\right)\right) \subset S$. We can write

$$
\begin{gathered}
\left.\frac{\partial^{2} u}{\partial z_{n} \partial z_{m}}\right|_{\mathbf{z}=\mathbf{x}}=\int_{\partial D^{\prime}}\left[\left.\frac{\partial u(\boldsymbol{\eta})}{\partial \mathbf{n}_{\boldsymbol{\eta}}^{o}} \frac{\partial^{2} G_{+}(\mathbf{z}, \boldsymbol{\eta})}{\partial z_{n} \partial z_{m}}\right|_{\mathbf{z}=\mathbf{x}}-\left.u(\boldsymbol{\eta}) \frac{\partial^{2}}{\partial z_{n} \partial z_{m}}\left(\nabla_{\boldsymbol{\eta}} G(\mathbf{z}, \boldsymbol{\eta}), \mathbf{n}_{\eta}^{o}\right)\right|_{\mathbf{z}=\mathbf{x}}\right] d \sigma_{\boldsymbol{\eta}}= \\
=\int_{\partial D^{\prime}}\left(H_{1}(\mathbf{x}, \boldsymbol{\eta})-H_{2}(\mathbf{x}, \boldsymbol{\eta})\right) d \sigma_{\boldsymbol{\eta}}
\end{gathered}
$$

We estimate the last integral using the following elementary inequalities for the Green function $G_{+}$:

$$
\begin{aligned}
& \left.\left|\frac{\partial^{2} G_{+}(\mathbf{z}, \boldsymbol{\eta})}{\partial z_{n} \partial z_{m}}\right|_{\mathbf{z}=\mathbf{x}} \right\rvert\, \leq \frac{A \boldsymbol{\eta}_{N}}{|\mathbf{x}-\boldsymbol{\eta}|^{N+1}}, \\
& \left.\left|\frac{\partial^{3} G(\mathbf{z}, \boldsymbol{\zeta})}{\partial x_{n} \partial x_{m} \partial \zeta_{l}}\right|_{\mathbf{z}=\mathbf{x}, \boldsymbol{\zeta}=\boldsymbol{\eta}} \right\rvert\, \leq \frac{A}{|\mathbf{x}-\boldsymbol{\eta}|^{N+1}},
\end{aligned}
$$

where $A=A(N)$. Then

$$
\begin{gathered}
\int_{S^{\prime}}\left|H_{1}(\mathbf{x}, \boldsymbol{\eta})\right| d \sigma_{\boldsymbol{\eta}} \leq M_{u} \int_{0}^{r_{0}} \frac{A \varepsilon(r) r r^{N-2} d r}{\left(r^{2}+x_{N}^{2}\right)^{\frac{N+1}{2}}} \leq \\
\leq A M_{u} \varepsilon\left(x_{N}\right) \int_{0}^{x_{N}} \frac{r^{N-1} d r}{x_{N}^{N+1}}+A M_{u} \int_{x_{N}}^{r_{0}} \frac{\varepsilon(r) d r}{r^{2}}=A M_{u}\left(\frac{\varepsilon\left(x_{N}\right)}{N x_{N}}+\frac{\lambda_{2}\left(x_{N}\right)}{x_{N}}\right),
\end{gathered}
$$

where $\lambda_{2}(t)=t \int_{t}^{r_{0}} \frac{\varepsilon(r)}{r^{2}} d r$ is Dini-type function by Lemma 3.11. Also, by (4.7),

$$
\int_{S^{\prime}}\left|H_{2}(\mathbf{x}, \boldsymbol{\eta})\right| d \sigma_{\boldsymbol{\eta}} \leq \int_{0}^{r_{0}} \frac{A}{\left(r^{2}+x_{N}^{2}\right)^{\frac{N+1}{2}}} \omega_{2}(r) r r^{N-2} d r
$$

can be estimated similarly. Finally, the analogous integrals over $\partial D^{\prime} \backslash S^{\prime}$ are estimated trivially.

Theorem W2 now is also completely proved.
Theorem 4.8. In conditions of Theorem 4.5 let $\psi_{0} \in C^{1}(S)$ be a $C^{1}$-Dini function on $S$, which means that there is $\psi \in C_{0}^{1}\left(\mathbb{R}^{N}\right)$ with $\left.\psi\right|_{S}=\psi_{0}$ and

$$
\begin{equation*}
|\nabla \psi(\mathbf{x})-\nabla \psi(\mathbf{y})| \leq \omega(|\mathbf{x}-\mathbf{y}|), \quad \forall \mathbf{x}, \forall \mathbf{y} \in \mathbb{R}^{N} \tag{4.8}
\end{equation*}
$$

where function $\omega(\cdot)$ is a Dini-type function. Let $u_{i}$ be the Dirichlet solution in $D$ with the boundary data $\psi_{0}$. Then $u_{i} \in C^{1}(\bar{D})$ and

$$
\begin{equation*}
\left\|u_{i}\right\|_{1, \bar{D}} \leq A\left(\|\nabla \psi\|_{\partial D}+\int_{0}^{r_{0}} \frac{\omega(r)}{r} d r+\omega(d)\right) . \tag{4.9}
\end{equation*}
$$

For instance, if $\psi_{0} \in C^{2}(S)$ then

$$
\begin{equation*}
\left\|u_{i}\right\|_{1, \bar{D}} \leq A\left\|\psi_{0}\right\|_{2, S} \tag{4.10}
\end{equation*}
$$

Proof. Let us first estimate $\left\|\nabla u_{i}\right\|_{\bar{D}}$. To this end it suffices to estimate $\mid u_{i}\left(\mathbf{0}^{\prime}, x_{N}\right)-$ $u_{i}(\mathbf{0}) \mid / x_{N}$, where $\mathbf{0} \in S, x_{N} \in\left(0, r_{0} / 2\right)$ and $\mathbf{0}$ is the closest to $\mathbf{x}=\left(\mathbf{0}^{\prime}, x_{N}\right) \in D$ on $S$. In fact, if $\mathbf{z} \neq 0$ is (fixed) small enough vector, then the function $\left(u_{i}(\mathbf{x}+\mathbf{z})-u_{i}(\mathbf{x})\right) /|\mathbf{z}|$ is harmonic in $D \cap\{\mathbf{x}-\mathbf{z} \mid \mathbf{x} \in D\}$, and so attains it's extremums when $\mathbf{x} \in S$ or $\mathbf{x}+\mathbf{z} \in S$. Therefore, it is enough to take $\mathbf{x}+\mathbf{z}=\mathbf{0} \in S$ and suppose that $\mathbf{0}$ is the closest to $\mathbf{x}=\left(\mathbf{0}^{\prime}, x_{N}\right)$ on $S$ (the last uses also the fact that $\left.u_{i} \in C^{1}(S)\right)$. Now, by Theorem 4.7, $G(\mathbf{x}, \mathbf{y}) \in C^{1}(\bar{D} \backslash\{\mathbf{y}\})$, so we already have a right to use formula (3.6), which gives

$$
u_{i}(\mathbf{x})-u_{i}(\mathbf{0})-(\nabla \psi(\mathbf{0}), \mathbf{x})=-\int_{S} \frac{\partial G(\mathbf{x}, \mathbf{y})}{\partial \mathbf{n}_{\mathbf{y}}^{i}}(\psi(\mathbf{y})-\psi(\mathbf{0})-(\nabla \psi(\mathbf{0}), \mathbf{y})) d \sigma_{\mathbf{y}}
$$

By (4.8) we have $|\psi(\mathbf{y})-\psi(\mathbf{0})-(\nabla \psi(\mathbf{0}), \mathbf{y})| \leq \omega(|\mathbf{y}|)|\mathbf{y}|$, and so, by Theorem 4.5 (3),

$$
\begin{gathered}
\frac{\left|u_{i}(\mathbf{x})-u_{i}(\mathbf{0})\right|}{x_{N}} \leq|\nabla \psi(\mathbf{0})|+\frac{1}{x_{N}} \int_{S} \frac{A_{1} x_{N} \omega(|\mathbf{y}|)|\mathbf{y}| d \sigma_{\mathbf{y}}}{|\mathbf{x}-\mathbf{y}|^{N}} \leq \\
\leq|\nabla \psi(\mathbf{0})|+A_{2} \int_{0}^{r_{0}} \frac{\omega(r)}{r} d r+A_{2} \omega(d) \int_{S_{r_{0}}^{*}} \frac{d \sigma_{\mathbf{y}}}{|\mathbf{y}|^{N-1}}
\end{gathered}
$$

where $S_{r_{0}}^{*}=\left\{\mathbf{y} \in S| | \mathbf{y} \mid \geq r_{0}\right\}$.
We claim that

$$
\begin{equation*}
\int_{S_{r_{0}^{*}}^{*}} \frac{d \sigma\left(\left.\mathbf{y}\right|^{N-1}\right.}{\left\lvert\, A_{N} \frac{d}{r_{0}} .\right.} \tag{4.11}
\end{equation*}
$$

To check this, consider the system of equal disjoint cubes $\left\{K_{j}\right\}_{j \in \mathbb{Z}^{N}}$ (with the side length $\left.l=r_{0} / \sqrt{N}\right)$ covering $\mathbb{R}^{N}$, that is

$$
K_{j}=\left\{\mathbf{z} \in \mathbb{R}^{N} \mid j_{n} l \leq z_{n}<\left(j_{n}+1\right) l, n \in\{1, \ldots, N\}\right\}
$$

$j=\left(j_{1}, \ldots, j_{N}\right) \in \mathbb{Z}^{N}$. If $K_{j} \cap S \ni \mathbf{a} \neq \emptyset$ then $K_{j} \subset Q_{\mathbf{a}}$ and so $\sigma\left(S \cap K_{j}\right) \leq \sigma(S \cap$ $\left.Q_{\mathbf{a}}\right) \leq A_{N} r_{0}^{N-1}$. For $m=1,2, \ldots$ let $N_{m}$ be the number of cubes $Q_{j}$ that intersect $B\left(\mathbf{0},(m+1) r_{0}\right) \backslash B\left(\mathbf{0}, m r_{0}\right)$, so that, clearly, $N_{m} \leq A_{N} m^{N-1}$. Therefore,

$$
\begin{equation*}
\int_{S_{r_{0}}^{*}} \frac{d \sigma_{\mathbf{y}}}{|\mathbf{y}|^{N-1}} \leq \sum_{m=1}^{d / r_{0}} \frac{A_{N} r_{0}^{N-1} m^{N-1}}{\left(r_{0} m\right)^{N-1}} \leq A_{N} \frac{d}{r_{0}} \tag{4.12}
\end{equation*}
$$

By this we proved that $\left\|\nabla u_{i}\right\|_{D}$ is bounded and, as soon as we prove that $u_{i} \in C^{1}(\bar{D})$, we also immediately obtain (4.9). To check that $u_{i} \in C^{1}(\bar{D})$ it suffices to repeat the second part of the proof of Theorem 4.7, where we used the property (4.6), which corresponds to (4.8).

Finally, if $\psi_{0} \in C^{2}(S)$ we can find $\psi \in C_{0}^{2}\left(\mathbb{R}^{N}\right)$ with $\|\psi\|_{2} \leq 2\left\|\psi_{0}\right\|_{2, S}=M$, so that for the corresponding $\omega(\cdot)$ we have

$$
\omega(t) \leq 2 M t \quad \text { and } \quad \omega(d) \leq 2 M
$$

Then (4.9) gives (4.10).
Theorem 4.9. Let $D$ be a (L-D) domain in $\mathbb{R}^{N}$ with the Dini-type function $\varepsilon(\cdot)$ and $d=\operatorname{diam} D$. Then there is a function $C(t)=C(N, d, \varepsilon(\cdot), t)>0$ on $(0,+\infty)_{t}$ such that for each $\mathbf{y} \in D$ we have

$$
\begin{equation*}
-\frac{\partial G(\mathbf{x}, \mathbf{y})}{\partial \mathbf{n}_{\mathbf{x}}^{i}} \geq C(\rho(\mathbf{y})), \quad \forall \mathbf{x} \in \partial D \tag{4.13}
\end{equation*}
$$

where $G$ is the Green function for $D$.

Proof. Let $\mathbf{0} \in S=\partial D,\{0, \ldots, 0,1\}=\mathbf{n}_{\mathbf{0}}^{i}$ (for $D$ ), and $r_{0}, D^{\prime}, S^{\prime}$ are defined in the proof of Theorem 3.1. Let $G_{+}$and $G^{\prime}$ be the Green functions for $\mathbb{R}_{+}^{N}$ and $D^{\prime}$ respectively. Take $\mathbf{y}=\left(\mathbf{y}^{\prime}, y_{N}\right)$ and $\mathbf{x}=\left(\mathbf{x}^{\prime}, x_{N}\right)$ with $0<x_{N}<y_{N} / 2<r_{0} / 4$ (so that $|\mathbf{y}-\mathbf{x}|>y_{N} / 2$ ). By the (second) Green formula,

$$
\begin{equation*}
G(\mathbf{x}, \mathbf{y})-G_{+}(\mathbf{x}, \mathbf{y})=\int_{\partial D^{\prime}} G_{+}(\mathbf{z}, \mathbf{x}) \frac{\partial}{\partial \mathbf{n}_{\mathbf{z}}^{i}} G(\mathbf{z}, \mathbf{y}) d \sigma_{\mathbf{z}} \tag{4.14}
\end{equation*}
$$

It can be easily checked that there are $A_{1}=A_{1}(N)$ and $A_{2}=A_{2}(N)$ in $(0,+\infty)$ such that

$$
\begin{gather*}
-G_{+}(\mathbf{x}, \mathbf{y}) \geq A_{1} x_{N}|\mathbf{x}-\mathbf{y}|^{1-N}  \tag{4.15}\\
-G_{+}(\mathbf{z}, \mathbf{x}) \leq A_{2} x_{N} z_{N}|\mathbf{x}-\mathbf{z}|^{-N}, \quad \forall \mathbf{z} \in \mathbb{R}_{+}^{N} . \tag{4.16}
\end{gather*}
$$

Fix $\delta \in\left(0, r_{0} / 3\right]$ and let $S_{\delta}^{\prime}=\left\{\mathbf{z} \in \partial D^{\prime}| | \mathbf{z}^{\prime} \mid \leq \delta\right\}, S_{\delta}^{*}=\partial D^{\prime} \backslash S_{\delta}^{\prime}$. By (4.16) and (2) of Theorem 4.5,

$$
\begin{align*}
& \left|\int_{S_{\delta}^{\prime}} G_{+}(\mathbf{z}, \mathbf{x}) \frac{\partial}{\partial \mathbf{n}_{\mathbf{z}}^{i}} G(\mathbf{z}, \mathbf{y}) d \sigma_{\mathbf{z}}\right| \leq \int_{S_{\delta}^{\prime}} \frac{A_{2} x_{N} z_{N}}{|\mathbf{x}-\mathbf{z}|^{N}} \frac{A_{3}}{|\mathbf{z}-\mathbf{y}|^{N-1}} d \sigma_{\mathbf{z}} \leq \\
& \quad \leq A_{4} \frac{x_{N}}{|\mathbf{y}|^{N-1}} \int_{\left|\mathbf{z}^{\prime}\right|<\delta} \frac{\varphi_{\varepsilon}\left(\left|\mathbf{z}^{\prime}\right|\right) d \mathbf{z}^{\prime}}{|\mathbf{x}-\mathbf{z}|^{N}} \leq A_{5} \frac{x_{N}}{|\mathbf{y}-\mathbf{x}|^{N-1}} \int_{0}^{\delta} \frac{\varepsilon(r)}{r} d r . \tag{4.17}
\end{align*}
$$

Also by (1) and (3) of Theorem 4.5,

$$
\begin{gather*}
\left|\int_{S_{\delta}^{*}} G_{+}(\mathbf{z}, \mathbf{x}) \frac{\partial}{\partial \mathbf{n}_{\mathbf{z}}^{i}} G(\mathbf{z}, \mathbf{y}) d \sigma_{\mathbf{z}}\right| \leq \int_{S_{\delta}^{*}} \frac{A x_{N}}{|\mathbf{x}-\mathbf{z}|^{N-1}} \frac{y_{N}}{|\mathbf{y}-\mathbf{z}|^{N}} d \sigma_{\mathbf{z}} \leq \\
\leq A_{6} x_{N} y_{N} \int_{S_{\delta}^{*}} \frac{d \sigma_{N}}{|\mathbf{z}|^{2 N-1}} \leq A_{7} \frac{x_{N} y_{N}}{\delta^{N}} \tag{4.18}
\end{gather*}
$$

where the last inequality can be checked the same way as in (4.12):

$$
\int_{S_{\delta}^{*}} \frac{d \sigma_{\mathbf{z}}}{|\mathbf{z}|^{2 N-1}} \leq \sum_{m=1}^{r_{0} / \delta} \frac{A_{N} \delta^{N-1} m^{N-1}}{(\delta m)^{2 N-1}} \leq \frac{A_{8}}{\delta^{N}}
$$

Fix (maximal) $\delta_{0} \in\left(0, r_{0} / 3\right]$ with the property (recall (4.15))

$$
\begin{equation*}
A_{5} \int_{0}^{\delta_{0}} \frac{\varepsilon(r)}{r} d r \leq \frac{1}{3} A_{1} \tag{4.19}
\end{equation*}
$$

and let $\mathbf{y}$ be such that

$$
\frac{A_{7} y_{N}^{N}}{\delta_{0}^{N}} \leq \frac{1}{3} A_{1}
$$

that is $y_{N}<\sqrt[N]{A_{1} / 3 A_{7}} \delta_{0}=\delta_{1}$, and so

$$
A_{7} y_{N} / \delta_{0} \leq \frac{1}{3} A_{1}|\mathbf{y}-\mathbf{x}|^{N-1}
$$

So, finally, by (4.14)-(4.19), for $y_{N}<\delta_{1}$ and all $x_{N}<y_{N} / 2$ we have (using maximum principle):

$$
\begin{equation*}
-G(\mathbf{x}, \mathbf{y}) \geq-G^{\prime}(\mathbf{x}, \mathbf{y}) \geq \frac{A_{1} x_{N}}{3|\mathbf{x}-\mathbf{y}|^{N-1}} \tag{4.20}
\end{equation*}
$$

which gives

$$
\left.\left|\frac{\partial G(\mathbf{x}, \mathbf{y})}{\partial x_{N}}\right|_{\mathbf{x}=\mathbf{0}} \right\rvert\, \geq \frac{A_{1}}{3|\mathbf{y}|^{N-1}} \geq \frac{A_{1}}{3 \delta_{1}^{N}} .
$$

Lemma 4.10. In conditions of Theorem 4.9 let $\mathbf{a} \in D$. There is $A_{9}=A_{9}(N) \in[1,+\infty)$ such that for each $\mathbf{b} \in B(\mathbf{a}, \rho(\mathbf{a}) / 8)$ one has

$$
A_{9}^{-1}|G(\mathbf{z}, \mathbf{a})| \leq|G(\mathbf{z}, \mathbf{b})| \leq A_{9}|G(\mathbf{z}, \mathbf{a})|
$$

for all $\mathbf{z} \in D$ with $\rho(\mathbf{z}) \leq \rho(\mathbf{a}) / 2$.
Proof. Use trivial inequality (the case $N \geq 3$ )

$$
\frac{1}{2}|\Phi(\mathbf{z}-\mathbf{a})| \leq|G(\mathbf{z}, \mathbf{a})| \leq|\Phi(\mathbf{z}-\mathbf{a})|, \quad|\mathbf{z}-\mathbf{a}|<\frac{\rho(\mathbf{a})}{2}
$$

and maximum principle for $-G(\mathbf{z}, \mathbf{a})$ and $-l G(\mathbf{z}, \mathbf{b})$ in $D \backslash B(\mathbf{a}, 3 \rho(\mathbf{a}) / 16)$ with an appropriate $l=l(N) \in(0,+\infty)$.

We are ready to finish the proof of Theorem 4.9. Fix any $\boldsymbol{\zeta} \in D$ and put $\rho_{1}(\boldsymbol{\zeta})=$ $\min \left\{\rho(\boldsymbol{\zeta}), \delta_{1}\right\}$. In our notations it suffices to prove that for all $x_{N} \in\left(0, \rho_{1}(\boldsymbol{\zeta}) / 4\right)$ one has

$$
-G\left(\left(\mathbf{0}^{\prime}, x_{N}\right), \boldsymbol{\zeta}\right) \geq x_{N} C(\rho(\boldsymbol{\zeta})) .
$$

Take $y_{N}=\rho_{1}(\boldsymbol{\zeta})$. One can find $M$ points $\left\{\boldsymbol{\zeta}_{m}\right\}_{m=1}^{M}$ with $\boldsymbol{\zeta}_{1}=\left(\mathbf{0}^{\prime}, y_{N}\right)=\mathbf{y}, \boldsymbol{\zeta}_{M}=\boldsymbol{\zeta}$, $\rho\left(\boldsymbol{\zeta}_{m}\right) \geq \rho_{1}(\boldsymbol{\zeta}) / 2, \boldsymbol{\zeta}_{m+1} \in B\left(\boldsymbol{\zeta}_{m}, \rho\left(\boldsymbol{\zeta}_{m}\right) / 8\right)$ and $M=M(N, d, \varepsilon, \rho(\boldsymbol{\zeta}))$. Applying Lemma 4.10 to $\mathbf{a}=\boldsymbol{\zeta}_{m}, \mathbf{b}=\boldsymbol{\zeta}_{m+1}(m \in\{1, \ldots, M-1\})$ we can finally take (by (4.20))

$$
C(\rho)=A_{9}^{-M} A_{1} / 3 \delta_{1}^{N},
$$

and (4.13) is proved.
Proof of Theorem W1. The proof of (1) for $u_{i}$ and $u_{o}$ in bounded components of $D_{0}$ follows immediately from Theorem 4.8. To prove (2) for $u_{i}$ we apply (3.6) to have

$$
\frac{\partial u_{i}(\mathbf{x})}{\partial x_{n}}=-\int_{S_{r}^{*}} \frac{\partial^{2} G(\mathbf{x}, \mathbf{y})}{\partial x_{n} \partial \mathbf{n}_{\mathbf{y}}^{i}} \psi(\mathbf{y}) d \sigma_{\mathbf{y}}
$$

where $\mathbf{x} \in D \cap \bar{B}(\mathbf{a}, r / 2)$ and $S_{r}^{*}=\{\mathbf{y} \in S| | \mathbf{y}-\mathbf{a} \mid \geq r\}$. By (4) of Theorem 4.5 then

$$
\left|\nabla u_{i}(\mathbf{x})\right| \leq A\|\psi\|_{S} \int_{S_{r}^{*}} \frac{d \sigma(\mathbf{y})}{|\mathbf{y}-\mathbf{a}|^{N}} \leq A_{10}\|\psi\|_{S} \frac{1}{r} \ln \frac{d}{r} .
$$

The last inequality can be proved as in (4.12):

$$
\int_{S_{r}^{*}} \frac{d \sigma_{\mathbf{y}}}{|\mathbf{y}-\mathbf{a}|^{N}} \leq \sum_{m=1}^{d / r} \frac{A_{N} r^{N-1} m^{N-1}}{(r m)^{N}} \leq \frac{A_{N}}{r} \sum_{m=1}^{d / r} \frac{1}{m}
$$

To finish the proof of (1) and (2) for $u_{o}$ in $D_{*}$ and (3) for $\omega$ in $D_{*}$, it is enough to apply the so called Kelvin transform (see (4.21) below ; for (3), additionally, use Theorem 4.9).

We can suppose that $\mathbf{0} \in D$ and $\rho(\mathbf{0}) \geq r_{0}$. The inversion $\mathbf{x} \rightarrow \mathbf{x}^{*}=\mathbf{x} /|\mathbf{x}|^{2}$ (via the unit sphere) maps some (L-D) domain $\tilde{D}$ (with the Dini-function $A \varepsilon(\cdot), A=A(N, d, \varepsilon)$ ) onto $D_{*} \cup\{\infty\}$. If $f_{*} \in H\left(D_{*}\right)$ and $f_{*}(\infty)=0$ (for $N \geq 3$, which gives $f_{*}(\mathbf{x})=O\left(|\mathbf{x}|^{2-N}\right)$ ) or $\left|f_{*}(\infty)\right|<+\infty$ (for $N=2$ ), the Kelvin transform (via the unit sphere) of the function $f_{*}$ is defined as

$$
\begin{equation*}
\tilde{f}(\mathbf{x})=|\mathbf{x}|^{2-N} f_{*}\left(\mathbf{x} /|\mathbf{x}|^{2}\right), \mathbf{x} \in \tilde{D} \tag{4.21}
\end{equation*}
$$

Then $\tilde{f} \in H(\tilde{D})$ and

$$
\Delta \tilde{f}(\mathbf{x})=|\mathbf{x}|^{-2-N}\left[\Delta f_{*}\right]\left(\mathbf{x} /|\mathbf{x}|^{2}\right), \quad \mathbf{x} \in \tilde{D}
$$

(see [11, Ch.13]).
