## Exercise 05, 12.10.2009

Problem sessions will be held on Monday at 16-18, B322.
N.B. The files mentioned in the exercises (if any) are available on the course homepage.

1. (a) Plot the functions $\operatorname{er} f(x)=\frac{2}{\sqrt{\pi}} \int_{0}^{x} \exp \left(-y^{2}\right) d y$ and $f(x)=\frac{1}{\sqrt{\pi}} \exp \left(-x^{2}\right)$ on the interval $[0,3]$. Note that $\operatorname{erf}(\mathrm{x})$ is a built-in function of MATLAB. Find the root of the equation $f(x)=\operatorname{erf}(x)$ on this interval.
(b) Show by change of variable that for $a, b \in R, a \neq 0, x_{1}<x_{2}$,

$$
\int_{x_{1}}^{x_{2}} \exp \left(-\frac{(x-b)^{2}}{\left(2 a^{2}\right)}\right) d x=a \sqrt{\frac{\pi}{2}}\left(\operatorname{erf}\left(\frac{x_{2}-b}{a \sqrt{2}}\right)-\operatorname{erf}\left(\frac{x_{1}-b}{a \sqrt{2}}\right)\right) .
$$

Verify this also by MATLAB experiments.
2. On the www-page is given the program hpl052.m which compares two methods of numerical integration, namely Riemann's sum and Simpson's Rule, over a rectangular region in the plane with the test function $f(x, y)=$ $x y$. The program prints the error.
(a) Modify the program to use the function $g(x, y)=\sin (2 x) * \cos (4 * y)$ and report the results.
(b) Write the code also for the Trapezoid Rule and the MATLAB builtin function dblquad and report the error. Provide an order or preference of the methods based on the accuracy of each method.
3. Use MATLAB to generate a picture of the Julia set of the iteration $z \mapsto z^{2}+a, a=0.3-i * 0.2$.
4. Suppose that $A$ is a non-singular $n \times n$ matrix with columns $A^{(j)}, j=$ $1, \ldots, n$, and $x$ and $b$ are $n \times 1$ vectors. By Cramer's Rule, the solution to $A x=b$ is given by

$$
x_{j}=\left((\operatorname{det}(A))^{-1}\right) \operatorname{det}\left(C_{j}\right), C_{j}=\left[A^{(1)} A^{(2)} \ldots A^{(j-1)} b A^{(j+1)} \ldots A^{(n)}\right] .
$$

Verify this procedure with MATLAB tests for small $n$. For how big values of $n$ this is a reasonable procedure?

[^0]5. The daily measurement data of a the body temperature of a patient are stored in files a1.txt,..., a7.txt in the format one measurement/line. Write a program that reads the measurements and plots a histogram (the command bar and hist may be useful here) of the results and computes the mean temperature.
6. Theorem 1.2.2 on p. 12 of P. Borwein-T. Erdélyi: Polynomials and Polynomial Inequalities Springer-Verlag, 1995 states that if $p(z)=a_{n} z^{n}+$ $a_{n-1} z^{n-1}+\ldots+a_{0}$ and $a_{0} \geq a_{1} \geq \ldots \geq a_{n}>0$ then all zeros of $p$ lies outside the open unit disk. Verify experimentally this statement by generating random coefficients $a_{j}$ and by plotting the roots in the plane.
