Workshop 5

Exercise 5 FILE: h05.tex printed on February 19, 2016at 14.18.

1. Interpolate the sine-function in the interval $[0, \pi/2]$ using the points

$$x_k = k * \pi/10$$
, $y_k = \sin(x_k)$, $k = 0, 1, ..., 5$.

Use the following different methods:

- (a) polynomial interpolation,
- (b) cubic spline interpolation, with $f'(0) = f'(\pi/2)$ as boundary condition (in GSL "periodic boundary condition").
- (c) cubic spline interpolation with natural boundary condition.

In each case, compute the maximum error at the points $z_i = k * \pi/200, k = 0, 1, ..., 100$.

- 2. Given f(1) = 1, f(2) = 125, f(3) = 729, f(4) = 2197, find a polynomial approximation for the numbers f(2+i*0.25), i=0,1,2,3,4, using the program polint or gpolint (polint is a NR function, gpolint can be found at the webpage). Find also the corresponding error estimates. Do the same thing for the data (i,f[i]), i=1,2,3,4, where f[i] is a random number.
- 3. Compute the values of the Γ function at the points x = 0.5 + 0.1 * j, j = 1, ..., 20, and form a spline approximation on this interval. Then estimate the maximal deviation of the approximation from the true value of the function by tabulating the difference with increment 0.01 on this interval.
- 4. Using the programs number and number (or gnumber and gnumber) and Gnuplot, make a program which draws a picture of a function and its second derivative. Draw also the sum of the function $\sin(x)$ and its second derivative, which is supposed to be zero.
- 5. Let A be an $m \times n$, $m \ge n$, matrix. Using random matrices, test the validity of the following statements for the pseudoinverse A^+ of A:
 - (a) $(A^+)^+ = A$,
 - (b) $(A^+)^{\top} = (A^{\top})^+$
 - (c) If B is a $n \times p$ matrix, then $(AB)^+ = B^+A^+$.

For item (c) consider separately the cases $p \ge n$ and p < n.

6. Fitting a second degree polynomial

$$p(t) = x_0 + x_1 * t + x_2 * t^2$$

to the data set (1,2),(2,2),(3,3),(3,5),(4,6) leads to the overdetermined system Ax = b with

$$A = [1, 1, 1; 1, 2, 4; 1, 3, 9; 1, 3, 9; 1, 4, 16]$$
 $b = [2; 2; 3; 5; 6]$

Find the coefficients of the polynomial (a) with the SVDsolve (b) with HOUSEsolve method.

Note: HOUSEsolve can be downloaded from the course www-page. It is part of the file myhouse.c(pp).
