University of Helsinki / Department of Mathematics and Statistics SCIENTIFIC COMPUTING Exercise 11, 28.11.2011

- **N.B.** The files mentioned in the exercises (if any) are available on the course homepage.
- 1. The Gram-Schmidt method also applies to orthogonalize a system of functions. Use this method to orthogonalize the system $\{1, x, x^2, x^4\}$. of the space C([-1,1]) with the inner product $(f,g)=\int\limits_{-1}^1 f(x)g(x)\,dx$.
 - 2. Part (b) of this problem deals with the so called Gibbs phenomenon.
 - (a) Show that for each fixed x the number $S_n(x) = \frac{nx}{1+n^2x^2}$ approaches zero when n grows to ∞ , and find the extremum values of $S_n(x)$ with respect to x. Graph the function $S_n(x)$ when n=2:2:10.
 - (b) Show that the Fourier series of $f(x)=(\pi-x)/2$ on $(0,2\pi)$ is $\lim_{n\to\infty}S_n(x)$, where $S_n(x)=\sum_{k=1}^n\frac1k\sin(kx)$. Graph S_n for n=10:2:20 and find graphically the global maximum $x_0\in(0,2\pi)$ of $S_n(x)$ and estimate graphically the number $|S_n(x_0)-f(x_0)|/|f(x_0)|$.

Recall the Fourier series of a continuous function $f:[0,2\pi] \to \mathbf{R}$

$$rac{1}{2}a_0+\sum_{n=1}^{\infty}(a_n\cos(nx)+b_n\sin(nx)),$$

where

$$a_n = rac{1}{\pi} \int_0^{2\pi} f(x) \cos(nx) dx, \ n = 0, 1, 2, \dots$$

and

$$b_n = rac{1}{\pi} \int_0^{2\pi} f(x) \sin(nx) dx, \ n = 1, 2, 3, \ldots$$

- 3. Find the *n*th partial sum of the Fourier series of $f(x) = x^2$ on $(0 < x < 2\pi)$ and graph it for n=4:2:10.
- 4. Consider again the problem of fitting a "line with a break point" to a data set, as in d101. Now, instead of choosing the break point (s,t) with a mouse click as we did in d101, use the method of the program parfit to find the best break point $(s,t) = (\lambda_1, \lambda_2)$. The object function will be, with

FILE: ~/mme/demo11/d11/d11.tex — 15. marraskuuta 2011 (klo 7.59).

the notation of the solution to d101, s1+s2. Apply this optimized version of d101 to the data of d101. Recall that the object function value obtained in d101, after the fitting was 2.62. Do you get a better value this time?

5. An astronomer has the following observations about a comet approaching the Earth.

Taulukko 1: Comet coordinates

Determine the equation of the comet on the basis of this data using a quadratic function

$$ay^2 + bxy + cx + dy + e = x^2.$$

Hint: The problem yields the overdetermined system

$$ay_i^2 + bx_iy_i + cx_i + dy_i + e = x_i^2$$
, $i = 1, ..., 10$,

which we will solve with the LSQ method for the coefficient vector $sol = (a, b, c, d, e)^T$. We rewrite this as M * sol = w and its solution is obtained with $sol = M \setminus w$ (or, alternatively, sol = pinv(M) * w).

6. Write a program numdf, which computes the numerical derivative of a function at the points in a given vector, using the function numder. The program call should be of the form

$$numdf('myf(x)',z, 1e-4)$$

where z = 0:0.05:1;, and myf is a function. Plot the error of the numerical derivation using the command pic('cos(x)- numdf('sin(x)'', x, 1e-4)'). Hint: The file hlp116.m contains numder and pic.
